RE: Hoffman, Jeanne Leonie
U8170135

To Whom It May Concern:

I have been the primary care physician for Jeanne Hoffman for many years. She suffers from several medical conditions and takes several medicines daily. Her son has been of great help in improving her compliance with medicines and self-care. It would be helpful if her son could continue to live with her.

Sincerely,

Electronically Reviewed/Signed On: 03/16/06 at 09:36

PROBLEM: ANTICOAGULATION DUE TO COAGULOPATHY AND PERIPHERAL VASCULAR DISEASE.

SUBJECTIVE: Phoned the patient to follow up as she stopped and got her prothrombin time drawn and went home. This is a little challenging to do by phone, as her hearing is not the best. She is able to tell me that her current dose of warfarin is one tablet (10 mg) on Monday, Wednesday, Friday, and Sunday, and 1/2 tablet (5 mg) on Tuesday, Thursday, and Saturday. She has no complaints or problems. Has not noticed any bruising.

OBJECTIVE: INR 2.9 on January 31 (goal 2 to 3).

ASSESSMENT: Adequate anticoagulation without complications or problems.

PLAN: Will continue current warfarin dose as above and recheck in one month.

AUDIOLOGY CLINIC NOTE

SUBJECTIVE: This very nice woman returned to the clinic today with complaint that she is experiencing increasing difficulty hearing. She is currently still wearing a Phonak BTE which she obtained at the University of Washington Speech and Hearing Clinic several years ago. She reported experimenting with her right hearing aid in her left ear and noticing improvement. She would like to have her hearing re-evaluated today, have her right hearing aid checked, and discuss the possibility of obtaining a hearing aid for her left ear.

OBJECTIVE: Otoscopic inspection revealed unobstructed ear canals bilaterally. Puretone air and bone conduction testing revealed a mild sloping to severe sensorineural loss across frequencies in the left ear and the right ear shows a relatively flat, moderate loss through 4000 Hz dropping to a severe loss at 6000 and above. As compared to previous audiometric results, these are essentially stable thresholds with only a 10 dB drop at 6000 Hz bilaterally. Although her puretone thresholds changed minimally, her speech discrimination ability changed significantly, from 96% correct to 84% in the right ear, and from 84% correct in the left ear to 72% correct in the left ear. In addition, the patient's word recognition ability diminished greatly with an increase to the presentation level by nearly 20% in the left ear, down to 56% correct.

The patient's hearing aid was cleaned, checked and retubed. It appears to be working well. Hearing aid options for the left ear were only briefly discussed as she should seek an otologic evaluation prior to pursuing this option.

ASSESSMENT: Right hearing aid cleaned, checked, retubed. Hearing sensitivity relatively stable with decrease in word recognition ability. Recommend otologic evaluation prior to pursuing additional hearing aid for the left ear.

PLAN: The patient will return to the clinic in late February 2006 once she has completed scheduled dental surgery for a complete otologic evaluation. At that time, medical clearance will be requested to pursue additional amplification and the patient will be scheduled to have a continuation of her hearing aid evaluation, if cleared.

Charge today for puretone air conduction thresholds, threshold discrimination, limited, and hearing aid monaural check.

Allan J Ellsworth, Pharm.D.
UWMC Pharmacy and Family Medicine
RE: Jeanne Hoffman U8170135

Dear Allan Ellsworth:

Thank you for the opportunity to see your patient, Jeanne Hoffman. She was evaluated in Dermatology Clinic on 1/11/2006 for her chest rash which has been ongoing for approximately one year. She describes a sensation of "worms" under her skin and feels the need to "pop" these areas lest they grow. She states they occasionally migrate through her skin and travel to her arms. She has tried fluocinonide cream in the past and states that this made her tender. On exam she has lichenification and hyperpigmentation on her upper anterior chest. She has scattered seborrheic keratoses within this area, and she does have a mild follicular prominence on her mid chest.

In assessment, the majority of her cutaneous findings appear secondary to chronic manipulation. She did use the word worms on several occasions, and it is possible that she may have delusions of parasitosis. This was discussed with the patient who was vague regarding the notion of a concern for an infestation. We do not find any evidence of an infestation nor a cutaneous infection.

Our current recommendations are for a trial of Zonalon 5% cream bid and AmLactin which may help with the follicular prominence. I am concerned that there may be a component of dementia and in this elderly lady some of the typical medications we might use including tricyclics or antipsychotics may have some side effects, and I would like to work with you or her primary care provider with regard to potentially initiating these in the future. We will see her back in eight weeks' time.

Patient was staffed with a guest attending, Dr. Levisohn.

Sincerely,

Electronically Reviewed/Signed On: 01/18/06 at 13:22

28484

PROBLEM: RASH.

SUBJECTIVE: This is a patient of Dr. Neighbor who I have followed intermittently for anticoagulation over the years. She presents today with continued complaints of a nonpruritic, recurring, papular rash on her arms and chest despite a single treatment with permethrin (which she says did nothing). Continuous for several months triamcinolone 0.25% cream applied which she says helps for a while. A biopsy failed to provide any useful information because of subtle and nonspecific findings. She would like to put a name and a resolution. She describes these as little pimples which she is able to express clear fluid from.

MEDICATIONS: She is on a number of medications for a number of chronic medical problems including:
1. Carbamazepine.
2. Pentoxifylline.
3. Warfarin.
4. Calcium carbonate.
5. Hydrochlorothiazide.
6. Atorvastatin.
7. Acetaminophen.
8. Timoptic (ophthalmic).
9. Xalatan (ophthalmic).

ALLERGIES: PENICILLIN AND SEPTRA (BOTH HAVE CAUSED A RASH).

OBJECTIVE: Pleasant hard of hearing elderly woman in no acute distress. VITAL SIGNS: Weight 153. Blood pressure 120/70. Pulse 78. SKIN: There are multiple areas where she has pinched and caused bruises on her arms and chest. A couple of lesions that she has yet to get to appear to be small urticarial lesions, but there is somewhat of a papular lesion on the top. They are, again, nonpruritic. There is no evidence of excoriation.

ASSESSMENT: Nonspecific chronic urticarial/papular rash, not responsive to steroids topically.

PLAN: Dermatology consultation. Hopefully, they can give us some direction in terms of management. Certainly, we could start the process of discontinuing medications, those with sulfa similar structures first. It may just be a neurodermatitis. Hopefully, Dermatology's wisdom will strike a cord with her appearance and some resolution can be attempted. In the meantime, I have added ranitidine (which I think will be safe with her Coumadin) 150 mg twice daily to provide a little bit of antipruritic, perhaps antiurticarial activity. I am hesitant to give her anything with more sedative activity because she is a bit unstable on her feet as it is.

PROBLEM: ANTICOAGULATION (COAGULOPATHY).

SUBJECTIVE: Patient returns for routine prothrombin time monitoring. This is without schedule. Has recently seen Dr. Zierler and Dr. Neighbor. There has been some discussion about discontinuing Warfarin, as the risks and benefits may be different now with her unsteadiness of gait, etc, compared to when it was originally initiated. She is hesitant to stop. She has not got a clear opinion from anybody.

Continues to take Warfarin at her set dose: 10 mg Monday, Wednesday, Friday, Sunday; 5 mg Tuesday, Thursday, and Saturday without difficulties or problems. Other medicines unchanged: carbamazepine 200 mg tid, timolol 0.5% ophthalmic twice daily, hydrochlorothiazide 12.5 mg daily, and atorvastatin 40 mg daily.

OBJECTIVE: Prothrombin time as INR 2.9.

ASSESSMENT: Adequate and safe, thus far, anticoagulation in this elderly quite unstable woman who lives alone on Bainbridge Island, but is quite fiercely independent.

PLAN: Continue warfarin at above dose for now. No change in regimen. Recheck in one month. Followup with Dr. Neighbor for primary care.

VASCULAR SURGERY CLINIC NOTE

IDENTIFICATION: This 80-year-old woman is referred back to the Vascular Surgery Clinic by Dr. William Neighbor for an opinion regarding stopping her Coumadin.

The patient was last seen in this clinic in 2002 when she came in requesting a new prescription for elastic support stockings. She developed an episode of bilateral lower extremity deep vein thrombosis in the 1980s following a hysterectomy. She went on to have symptomatic post-thrombotic syndrome with chronic lower extremity swelling, pigmentation, and cycles of ulceration and healing. She underwent a split thickness skin graft to a right medial ankle ulcer in 1996.

She states that she has generally been doing well with regard to her lower extremities. She had two small ulcers on her left leg recently, but these have healed. She uses elastic support stockings on a regular basis to control swelling. She states that her legs still have a tendency to swell, particularly if she is on her feet a lot. She continues to take Coumadin, and she has done so for most of the last 20 years. She states that she has never really been off of her Coumadin for more than a few days in relation to invasive procedures.

CURRENT MEDICATIONS:
1. Coumadin.
2. Trental.
3. Tegretol.
4. Lipitor.
5. Hydrochlorothiazide.

LABORATORY DATA: Her most recent INR value was 2.8 on 8/1/2005.

STUDIES: Her last lower extremity venous duplex scan was performed in December of 2001, and this showed patent deep veins in the lower extremities with no acute changes.

PHYSICAL EXAMINATION: VITAL SIGNS: Blood pressure 130/70, pulse 82, temperature 36.9. GENERAL: She is an elderly woman in no acute distress. LOWER EXTREMITIES: Observation of her legs reveals the previously noted pigmentation and subcutaneous fibrosis. She has no active ulceration at this point in time, and her swelling appears to be well-controlled with some knee-high elastic support stockings.

ASSESSMENT/PLAN: In summary, this 80-year-old woman has a long history of post-thrombotic syndrome, and she has been on Coumadin for many years. Since she has never tried stopping her Coumadin, there is no historical information to indicate how she would do without anticoagulation. However, her history suggests that her original episode of deep vein thrombosis was related to a reversible risk factor, specifically a hysterectomy. Her last duplex scan did not show any major abnormalities. Therefore, it is possible that she would tolerate being off of her Coumadin without recurrent venous thromboembolism.

In order to provide some updated information on the status of her lower extremity veins, a venous duplex scan will be requested. If this continues to show minimal changes, then a trial of stopping her Coumadin would be reasonable. There is justifiable concern about the risk of continued Coumadin in this patient who is becoming elderly and somewhat unstable on her feet, with a risk of falling.

She will be scheduled for her venous duplex scan and return when the results are available to discuss further management.

PROBLEM: SKIN PAPULES.

SUBJECTIVE: See last clinic note. In for punch biopsy today. She states the recurrent papules are migrating down below her breast area. Her INR is therapeutic.

OBJECTIVE: VITAL SIGNS: See chart. CHEST: Shows slightly red, small papules on erythematous base over upper chest wall, numbering about five and about five below her breast, but not in the intertriginous area, rather on her upper abdomen. She has areas of hemosiderin deposit in her left upper chest related to chronic itching in this area. The patient tends to try to pop these small papules. She has been tried on multiple lotions, as noted previously.

PROCEDURE: Following verbal informed consent, sterile preparation of the skin and local anesthesia with 1% Lidocaine with epinephrine, a 4 mm punch biopsy was performed and specimen submitted to pathology. Good hemostasis with time alone. Bandage with paper tape applied, as patient is sensitive to regular band-aids.

ASSESSMENT: Skin papules. Punch biopsy pending. Will call with results.

19828

PROBLEM: FOLLOWUP RASH.

SUBJECTIVE: See note dated July 7. She has not responded to more potent corticosteroid. The nature of the lesions are exactly as described in that note. She comes in today for followup.

PROBLEM: HYPERTENSION.

SUBJECTIVE: She continues on hydrochlorothiazide at a dose listed below without side effects. No interval blood pressure measurements other than those obtained in the clinic. PROBLEM: FOLLOWUP FALL.

SUBJECTIVE: In the early summer she had a fall. She was almost hospitalized. She has recovered from this, but it does raise the question that as she is getting older and continuing to have periodic falls and become more unsteady on her feet. Whether the risks outweigh the benefit of continuing her on Coumadin. She has not been seen in Vascular Clinic where she was followed for some time for recurrent DVTs. It may be well to refer her back to Vascular Clinic with a question about whether she should continue on Coumadin. She does continue to wear elastic stockings.

MEDICATIONS:
1. Xalatan 0.005% eyedrops, one drop in each eye at bedtime.
2. Pentoxifylline 400 mg tid.
3. Hydrochlorothiazide 25 mg 1/2 tablet daily.
4. Tegretol 200 mg tid.
5. Lipitor 40 mg nightly.
6. Warfarin as per last note by Allan Ellsworth.

OBJECTIVE: Weight 147, blood pressure 130/78, pulse 82 and regular. Her weight is stable. CHEST: Clear. CORONARY: S1 and S2 normal without murmur, gallop, or rub. EXTREMITIES: Show trace lower extremity edema that is probably related to the hot weather as she describes. She is wearing knee high elastic stockings. SKIN: Examination of her chest wall shows slightly raised macules, which the patient has squeezed, and there are areas of redness and some scarring. These are primarily over the left chest wall, though she describes it over the right chest wall, though I do not see any areas of redness or scarring in that area. In the left chest wall there is also brownish discoloration, probably secondary to hemosiderin deposits. She gets these in her axilla as well, but does not have any currently.

LABORATORY: Last basic metabolic panel one year ago.

ASSESSMENT AND PLAN:
1. Skin rash, which begins as papules. The patient, as described previously, notes that when she

squeezes these areas a yellowish, worm-like object comes out, which may simply be sebaceous fluid. I have asked her not to squeeze these in the next week and to return, and we would do a punch biopsy at that time on an appropriate lesion.

2. Hypertension. Well controlled based upon office readings today. Basic metabolic panel ordered, continue hydrochlorothiazide at dose above.

3. History of recurrent deep venous thrombosis (DVT) since 1982. I would like her evaluated in Vascular Clinic, where she has not been seen for three years, to determine whether, in view of her age and greater instability of her gait and recent fall she should continue on Coumadin, that is, whether the risks outweigh the benefits. This problem has been followed by Dr. Strandness and Dr. Zierler in Vascular Clinic in the past.

REASON FOR VISIT: SKIN RASH.

HISTORY OF PRESENT ILLNESS: Ms. Hoffman is an 80-year-old female who is well known to the Roosevelt Family Medicine Clinic. She has a history of hypertension, deep venous thromboses and chronic venous stasis and venous stasis ulcers. Please refer to prior dictations for further details. She has the following concerns today:

1. Ms. Hoffman states that she has had a rash on her upper chest since about September of 2004. She has been seen by both Dr. Neighbors and Dr. Ellsworth for this and has used pHisoDerm soap and triamcinolone cream for this rash. She was initially started on triamcinolone 1% which worked for about two weeks and then stopped working and switched up to triamcinolone 5% which also worked for about two weeks and then stopped working. She describes the rash as small bumps underneath the skin. She is able to squeeze them and she will hear a popping noise. They will then express what she describes as a "white worm with a black eye." If she does not pop them, then they do recur. She states that these lesions are not painful but that they usually start with an itch before they are more noticeable. She again gets them in her axilla, more specifically in the left axilla, in her upper chest and underneath her bra line.

2. Right index finger. Ms. Hoffman states that she has been working outside in the garden a lot and has noticed a yellow thickened nail on the right side. It has not caused her any pain or discomfort.

3. Leg swelling, feet swelling. Ms. Hoffman states that over the past month she has noticed some increasing swelling of her legs and her feet starting below the knee level. She does state that she has been trying to walk more and has noticed that this has caused some increase in her swelling. She also is complaining of some pain over the areas on her left foot where she has had vein stripping and ulcers in the past.

CURRENT MEDICATIONS:
1. Coumadin.
2. Trental.
3. Tegretol.
4. Hydrochlorothiazide.
5. Lipitor.

ALLERGIES: PENICILLIN and SULFA.

OBJECTIVE: VITAL SIGNS: Weight 147, blood pressure 1156/67, pulse 68. GENERAL APPEARANCE: Well-developed, well-nourished, elderly female in no acute distress. She is alert and oriented times three and answering questions appropriately. She is very pleasant to speak with. SKIN: Examination does not reveal any obvious rash on her upper chest. There are two lesions on

her left upper chest that seem to be healing open lesions, approximately 3 mm in diameter. I am not able to palpate necessarily any of the lesions that Ms. Hoffman is describing. There is no evidence of any rash in her left axillary area or underneath her bra. EXTREMITIES: Examination reveals trace, if any, pitting edema of her lower extremities starting at her shins. She does have compression stockings in place. She is mildly tender over the left medial aspect of her foot where she has had ulcers in the past. There is no evidence of ulceration at this time. The area is not erythematous or warm to touch compared to the rest of her skin. Chronic venous stasis change are noted on her legs, left more so than right.

ASSESSMENT AND PLAN:
Ms. Hoffman is an 80-year-old female with a complicated past medical history who presents to clinic today for evaluation of several issues.

1. Skin rash. I am not exactly sure what this skin rash specifically, given that steroid cream has helped in the past. I think we can try a stronger medication for a short period of time. I have given her a prescription for Lidex which she is to use twice a day for about a week. I have also recommended that she try some Cetaphil lotion which could decrease her body's own sebaceous gland secretions. I think that if this does not work, the next step would be to try some antibiotic ointments or gels to treat a possible folliculitis.

2. Right index finger onychomycosis. Given that this is not causing her any significant pain or discomfort, I think that no intervention is needed at this time. I explained to Ms. Hoffman that there are no good treatments for onychomycosis and those that are available do not work 100% of the time and are rather expensive. Ms. Hoffman was agreeable to no intervention at this time.

3. Lower extremity swelling and pain. I do not find any significant evidence of edema at this time. I think this is something that we can watch and see if it progresses any further. I also do not see any evidence of ulcers on her left foot. I do know that Ms. Hoffman takes really good care of her feet and does frequent checks. I think that we can watch this for the next week or so and see if it progresses. If so, she may need to be started on some diuretics for fluid retention.

4. Follow up appointment in this clinic with either Dr. Neighbor or Dr. Ellsworth in one week.

Patient was discussed with Dr. Kathleen Ellsbury who agrees with the above plan.

PROBLEM: ANTICOAGULATION (RECURRENT DVT), URINARY TRACT INFECTION, FALL.

SUBJECTIVE: Return visit for Prothrombin time monitoring. The patient taking stable dose of warfarin: 10 mg Monday, Wednesday, Friday, Sunday; 5 mg Tuesday, Thursday, Saturday. No complaints of bruising, bleeding, thromboembolic event. She does have back pain and has aches and pains from a recent fall. She was seen in the Emergency Room (see notes). Emergency Room physician was concerned about discharging her given her instability on feet, which appears fairly drastic, but is actually fairly stable. The thought about continuing warfarin anticoagulation in a patient so unstable on her feet is difficult. It is certainly, however, not new. Emergency room labs also contained a urine, with positive nitrite and positive leukocyte esterase. Further questioning finds dysuria, incontinence, but no back pains, nausea, vomiting, fever, chills.

She also has a rash on her chest, which is unresponsive to the permethrin originally prescribed by Dr. Neighbor, see previous note.

OBJECTIVE: A pleasant, elderly woman in no acute distress, her usual self. VITAL SIGNS: Weight 148 lb, blood pressure 130/72, no bruising or bleeding obvious for a quick examination. The rash on her chest is multiple small papules which are excoriated. There does not appear to be spreading to any other areas besides her chest.

UA obtained in the Emergency Room April 4, positive nitrite, positive leukocyte esterase and untreated.

LABORATORY: Prothrombin time is INR 2.8.

ASSESSMENT:
1. Anticoagulation. Stable, safe, therapeutic except in an elderly woman with a history of multiple falls. We will discuss this further with Dr. Neighbor, and perhaps might discuss it with the Vascular folks. Perhaps an alternative means of anticoagulation might be safer and equally effective.

2. Rash on chest, nonspecific dermatitis. Probably more appropriate to try a steroid at this point given lack of response to more specific therapy.

3. Urinary tract infection. Perhaps contributing to incontinence and predisposing for further conditions. I think the dysuria demonstrates enough symptoms to indicate treatment.

PLAN:
1. Ciprofloxacin 500 mg twice daily for five days.

2. Cut back on Coumadin to 5 mg each day for five days, while she takes warfarin, and increase back to her routine dose.

3. Triamcinolone 0.25% twice daily as needed to her rash.

4. Followup in one month. Will discuss with Dr. Neighbor regarding appropriateness of continued anticoagulation also in light of the falls.

EMERGENCY DEPARTMENT VISIT NOTE:

DATE OF SERVICE: 4/4/2005

TIME OF SERVICE: 1:30 PM

CHIEF COMPLAINT: Fall

HISTORY OF PRESENT ILLNESS: This is an 80-year-old female who has a long history of falls. She was at the bank today and fell backwards onto her head and back. She complains mostly of pain in her back. She is on Coumadin presently for "blood clots" in her legs. She denies any syncopal episodes. No chest pain, palpitations, or other complaints.

PAST MEDICAL HISTORY: Includes chronic falling along with glaucoma, peripheral vascular disease, a DVT, and a seizure disorder.

MEDICATIONS INCLUDE:
1. Coumadin.
2. Trental.
3. Hydrochlorothiazide.
4. Tegretol.
5. Lipitor.

ALLERGIES: SHE DENIES DRUG ALLERGIES.

SOCIAL HISTORY: She lives alone on Bainbridge Island. She denies alcohol or drug use.

PHYSICAL EXAMINATION: VITAL SIGNS: Normal. GENERAL: She was immobilized on a backboard initially. She is awake and alert. There are no signs of head injury. Pupils equal, round, reactive to light with accommodation. Extraocular motions are intact. NECK: Nontender. There is no JVD. LUNGS: Clear to auscultation. HEART: Sounds are regular, without murmurs or gallops. ABDOMEN: Shows normal active bowel tones, soft and nontender. PELVIS: Stable, nontender. BACK: Shows diffuse lumbar tenderness, mostly paraspinal to the right. There is no thoracic spine tenderness. EXTREMITIES: Show no evidence of trauma. No deformities. The pulses are symmetric and equal. NEUROLOGIC: Nonfocal. EMERGENCY DEPARTMENT COURSE: Labs were checked. Her CBC showed a white count of 8.2, hemoglobin and hematocrit of 14 and 41, and INR was 1.7. CT scan of her head was done which showed no evidence of intracranial abnormality. X-rays of her c-spine and l-spine showed no evidence of fracture or dislocation.

At this point, I see no significant complication related to her fall. She has remained hemodynamically

stable throughout her stay in the ER. She does have difficulty walking, however. She says she always has to hold on to things while she walks. I am a little uncomfortable letting her go home due to her difficulty walking with this increased pain in her low back. Patient adamantly refused hospitalization even though I have discussed with her the possibility that it might be just overnight. She was able to walk in the Emergency Department unassisted, from one end of the ER to the other, and continued to demand to be discharged. I did provide her with a few Tylenol with Codeine; she received a total of six tablets to go home with. We will provide her with a taxicab to get her to the ferry terminal, which is all she asked for. She will follow up with her primary doctor, Dr. Neighbor of the Family Medicine Clinic.

FINAL DIAGNOSIS: Fall, and back contusion.

PROBLEMS: FOLLOW UP PRURITUS.

SUBJECTIVE: See last clinic note. The patient was given Phisoderm soap prior to that visit, which in my opinion, had improved her sense of itching and the clear folliculitis that she had had on her shoulders. She, however, now continues to complain of pruritic red papules that occur in spotty distribution throughout her body, which she relates to having slept in unusual beds in Canada when she was visiting there with her son last summer. She states that she can press on these areas and express a "worm" that when she removes the pressure quickly disappears. She has never experienced this before.

PROBLEM: MEDICATION REFILLS. She is in need of refills of all of her medications.

PROBLEM: VENOUS STASIS DERMATITIS AND PERIPHERAL VASCULAR DISEASE.

SUBJECTIVE: She has noted slight red patch on the inner aspect of her left ankle above the medial malleolus. It had no ulceration. She states she has been perhaps walking too much.

PAST MEDICAL HX: Includes glaucoma, peripheral vascular disease, venous thombosis, seizure diorder.

MEDICATIONS: Xalatan 0.005% one drop in each eye at bedtime. Pentoxifylline 400 mg tid, hydrochlorothiazide 25 mg one half tablet daily, Tegretol 20 mg tid, Lipitor 40 mg qhs, warfarin overseen by Allen Ellsworth in our clinic.

OBJECTIVE: VITAL SIGNS: Weight 151, stable. Blood pressure 126/80. SKIN: Examination of her skin shows mild intertrigo beneath each breast. She does have occasional red, pruritic papules, which are minute. Pressure on these areas is not able to express anything. They are not pustular in nature. I do not see evidence of burrows. FEET: Examination of her feet show changes related to peripheral vascular disease and venous stasis disease. She has very slight red area measuring about 0.5 cm just above the medial malleolus, left ankle. I inspected her shoes and they seem to be wearing appropriately.

LABORATORY: February 11 a CBC was normal, Tegretol level with in therapeutic limits, INR 2.2, LDL cholesterol 104, HDL of 59, triglycerides 317.

ASSESSMENT AND PLAN:
1. Mild intertrigo. She should simply be sure to dry the area carefully and use baby powder.

2. Occasional pruritic papules. Differential includes flea bite or scabies, though I do not see any evidence of burrows. There is not any evidence of a folliculitis currently, so I do not think that she needs to continue to use Phisoderm, which she states is no longer helping. She does have a cat, but states the cat has not had problems with fleas. We therefore decided to treat her with permethrin 5% cream to be applied from neck to toes once, left on for eight hours and washed off and not reapplied. She should return should problem persist.

3. Hyperlipidemia with satisfactory LDL control. The Lipitor is costly for her, however, lovastatin was tried in the past and did not sufficiently lower her lipid values even at high dose.

4. Venous stasis dermatitis. She continues to take good care of her feet. She should watch the area that has recently been a bit sensitive, make sure ulceration does not appear. She has been very good about taking care of her feet.

5. Medication refills. Refilled all of her medications except for warfarin.

6. Nighttime urinary incontinence. She relates long history of nighttime urinary incontinence, which has not worsened recently. She has had no recurrent urinary tract infections (UTIs), she is simply requesting to see whether insurance would cover night-time urinary incontinence diapers for her. A prescription was written.

FAMILY MEDICINE TELEPHONE NOTE

PROBLEM
Anticoagulation (coagulopathy).

SUBJECTIVE
Patient returns for monthly prothrombin time monitoring. She has no complaints or problems. Denies bruising, bleeding, thromboembolic events. She continues to take warfarin 10 mg Monday-Wednesday-Friday and Sunday, 5 mg Tuesday-Thursday-Saturday. She is pretty clear on proper dosing.

OBJECTIVE
Prothrombin time as INR 2.2.

ASSESSMENT
Adequate anticoagulation without complications or problems.

PLAN
Continue warfarin at above dose. Recheck in one month.

PROBLEM: FOLLOW-UP FOLLICULITIS.

S: Patient was seen about 10 days ago for folliculitis which was treated with pHisoDerm soap for one week, then weekly. She is in today for followup. She states that there are little areas of thickening beneath her skin that when she squeezes them, something pops out. She thinks this may be related to a bug bite that she had last summer and hypothesizes that maybe there is some bug still beneath her skin.

O: Examination of her skin shows that the red papules noted at her last visit have resolved. Where she points that there is some thickening beneath her skin, I see nothing at all and I do not palpate anything, either. She does have a couple of areas of dry skin on her shoulders and upper arms that is consistent with winter itch. MENTAL STATUS: Patient is oriented times four. I have known the patient for some time, and she is not hallucinating that there are things beneath her skin, she just sometimes has odd ideas about what might be going on.

A/P:
1. Folliculitis, significantly improved. She can use the pHisoDerm soap as a soap once weekly.

2. Winter itch. She can use Vaseline or Vaseline Intensive Care lotion on the dry patches. She should follow up as needed.

PROBLEM: ANTICOAGULATION (COAGULOPATHY).

S: Patient returns for monthly prothrombin time monitoring, no complaints or problems. She does have ongoeing trouble with rash/dry skin and is arranging follow-up with Dr. Neighbor regarding that problem. Denies bruising, bleeding, thromboembolic symptoms. Warfarin dose is 5 mg Tuesday, Thursday, Saturday; 10 mg the rest of the days.

O: Prothrombin time is INR 2.5.

A: Adequate anticoagulation without problems.

P: Continue Warfarin dose above, recheck in one month.

PROBLEM: FOLLICULITIS.

SUBJECTIVE: One-week history of red pustules on upper chest which are not pruritic. No recent foreign travel other than a trip she made, I believe, to Europe last summer. There has been no recent change in her medications.

PROBLEM: HYPERCHOLESTEROLEMIA.

SUBJECTIVE: Allan Ellsworth is helping her apply for patient assistance program. She has been on her current dose of Lipitor since October, and is due for cholesterol test.

MEDICATIONS: Not reviewed at this visit.

OBJECTIVE: VITAL SIGNS: Per Family Medicine Clinic chart. SKIN: Shows about six small erythematous papules over her upper chest and upper back. These are not pruritic. She states that she has a few of these on her thighs.

ASSESSMENT/PLAN:
1. Folliculitis: Advise pHisoDerm soap to be used daily as a soap times one, done weekly for about four weeks. Prescription is written. Should enable this to be covered by her insurance, which I doubt.

2. Hypercholesterolemia: She is due for a lipid panel at her next blood draw for her INR on about 1/07/2005. She should follow up with us after that.

PROBLEM: MEDICATION MANAGEMENT, SEIZURE DISORDER, ANTICOAGULATION, GLAUCOMA, HYPERCHOLESTEROLEMIA.

S: Patient returned for a routine prothrombin time monitoring appointment, unscheduled, last week. Labs were drawn ahead of time. Therapeutic prothrombin time but out of whack cholesterol. Further questioning found that she could not afford to pay for the atorvastatin and hence has not refilled it. Other medicines each month are quite expensive, requires some give and take in order to afford them, including: Xalatan ophthalmic drops, Timoptic ophthalmic drops, hydrochlorothiazide, carbamazepine, Lipitor, warfarin, and pentoxifylline. These all total around $331 per month. She had never heard of any patient assistance programs.

A: Expensive pharmacotherapy, on fixed income.

P: The remainder of the appointment was spent on completing patient assistance forms for compassionate use of all her medications except hydrochlorothiazide and Trental, which were not available. She will continue to take all of her medicines except atorvastatin until these medications arrive. She has about a $5000 or $6000 total income and certainly qualifies for patient assistance, having Medicare as her only form of insurance

FAMILY MEDICINE TELEPHONE NOTE

PROBLEM
Anticoagulation, hypercholesterolemia.

SUBJECTIVE
Patient back from prolonged trip to France and just sliding back into the healthcare system. She was by late last month to have prothrombin time assessed. Also had cholesterol and liver function tests monitored. Results now available. Difficult to contact by phone, as it requires TDY telephone due to her hearing deficits. A note was sent to have her drop by to follow up on these results.

Prothrombin time as INR 2.0.

Lipid panel: Markedly elevated cholesterol, total cholesterol, and LDL cholesterol.

Presumed warfarin dose is 10 mg Monday, Wednesday, Friday and Sunday, with 5 mg Tuesday, Thursday, and Saturday. Presumed atorvastatin dose is 40 mg daily. I suspect she has been adherent to the Coumadin but not the atorvastatin. Will assess this with a note requesting her return for an appointment to get lipid-lowering therapy restarted as soon as possible.

PROBLEM: VAGINITIS.

SUBJECTIVE: Patient returned from a trip to France with her son this summer. She has noted in the last four months that she has recurrent tender, what she calls boils, just inside the vaginal introitus that will pop and drain and then resolve. She has taken to starting to pop these on her own. She denies any vaginal discharge or bleeding and denies fever, chills, or night sweats.

PROBLEM: LEFT INNER THIGH LESION.

SUBJECTIVE: She has had a lesion on her inner thigh that periodically bleeds and she wanted this examined. It has been present for about four months.

Past medical history and medications as reviewed notes on March 2 and March 23, 2004.

REVIEW OF SYSTEMS: She denies any other skin changes. She has not had any recurrent skin infections.

OBJECTIVE: Weight 144, down from 160 which is her usual weight. She has been trying to lose weight, particularly during her trip. VITAL SIGNS: Blood pressure 126/80, pulse 80 and regular. Examination of her left inner thigh shows small, well defined hemangioma which was frozen with liquid nitrogen today. GENITALIA: External genitalia normal. Examination with a speculum shows normal vaginal and cervical mucosa. The introitus looks normal without lesions. On palpation, I do not detect any areas of tenderness or lesions other than the fact that she has generalized tenderness on pelvic examination. The vaginal mucosa is atrophic.

ASSESSMENT/PLAN:
1. Vaginal introitus "boils" based on patient report. However, I do not find any evidence of abnormalities on exam today. I asked her to stop trying to "pop" these boils on her own and then return to see me when she has something that I am able to see on exam. KOH is pending.

2. Left thigh hemangioma frozen with liquid nitrogen. Expect complete healing. If recurs, should recheck.

3. Weight loss, apparently by intention. However, given quite large weight loss, from 160 down to 144 lbs, advise recheck her weight in three to four weeks.

4. Hypercholesterolemia. She is due for a lipid panel with LFTs. However, it appears that she discontinued her lipid-lowering medication when she was in France and has yet to re-initiate these. She is instructed to restart them and have a lipid panel done six weeks after.

FAMILY MEDICINE CLINIC NOTE

PROBLEM: Coagulopathy, peripheral vascular disease, anticoagulation.

SUBJECTIVE: Return visit just prior to leaving on four month vacation to Europe via train and boat for routine prothrombin time check. She is feeling a little nervous about going but does not complain of anything referable to her chronic diseases or anticoagulation except that she is having difficulty procuring medications. Her medicines are covered under DSHS who will only provide a 30-day supply. No exceptions. She has a 30-day supply on hand. She has purchased an additional 30 days, which leaves her 60 days without drugs and no additional funds to cover them.

MEDICATIONS:
1. Tegretol 200 mg tid.
2. Pentoxifylline 400 mg tid.
3. Hydrochlorothiazide 12.5 mg daily.
4. Timoptic 0.5%, a drop in both eyes bid.
5. Latanoprost 0.005%, a drop in both eyes bid.
6. Warfarin 10 mg on Monday, Wednesday, Friday, and Sunday with 5 mg on Tuesday, Thursday, and Saturday.
7. Atorvastatin 40 mg daily.
8. Celecoxib 12.5 mg daily.

OBJECTIVE: Prothrombin time is INR 1.9l.

ASSESSMENT: 1) Long-term coagulation for coagulopathy associated with peripheral vascular disease and history of recurrent thromboembolic problems - Adequate protection. 2) Multiple other problems reasonably stable; 3) Problems with medication supply during a prolonged stay out of country.

PLAN:
1. Continue warfarin at the same dose.
2. Have arranged with Safeway Pharmacy to mail her prescription at a set address in Europe each month during June and July. Encouraged patient to involve son, who will accompany her on trip, re: phone and e-mail verification of proper address.
3. Follow up when she returns in July.
4. Bon Voyage!

AUDIOLOGY CLINIC NOTE

SUBJECTIVE: Very nice, 79-year-old woman here for assistance with broken hearing aid and audiologic re-evaluation. Her last recorded audiogram is dated May 7, 2001, at which time, she presented with relatively stable, moderate to moderately severe sensorineural hearing loss in the right ear and mild to moderate sensorineural loss in the left ear. She denied noticing any changes in aural symptoms or balance. She presented her hearing instrument (a Phonak BTE which she says was fit with at the University of Washington Speech and Hearing Clinic), with tubing disconnected from the ear mold.

OBJECTIVE: Otoscopic inspection revealed unobstructed external ear canals bilaterally. Pure tone air conduction testing revealed stable thresholds to both ears when compared to her last audiometric record. Her speech discrimination ability was excellent in the right ear and good in the left ear, again, similar to previous results. The hearing instrument was thoroughly cleaned. There was evidence of rust in the battery compartment, and minimal debris build up in the screw ports and at the end of the ear hook. The ear mold was cleaned and retubed. The tubing used was super thick and measured to the hearing aid once upon the patient's
ear.

ASSESSMENT: In summary, the patient continues to present with a mild to moderate, severe sensorineural hearing loss bilaterally, right slightly worse than left. Her hearing instrument was cleaned and re-tubed and is working appropriately.

PLAN:
1. The patient was advised to use a dry-aid kit to address the evidence of rust build up in the battery compartment. She says she has one at home.

2. Follow-up audiometry every one to two years or if changes are noted sooner.

3. Return to clinic PRN for other hearing aid problems or aural symptoms and concerns.

Charge today for pure tone air threshold, discrim limited and hearing aid check monaural.

U8170135

PROBLEM: ANTICOAGULATION.

SUBJECTIVE: The patient returns today because last week her INR was subtherapeutic. Her INR today is therapeutic at 2.29. She has been compliant with her dose of medications and with her diet. Her diet is fairly constant and contains the same amount of green leafy vegetables regularly. She is still planning on going to France and will be returning in about six weeks. She did need refill of some of her medications.

MEDICATION: As dictated at her last clinic note February 24, 2004, with the following revisions:
1. Tegretol 200 mg tid.
2. Trental 400 mg tid.
3. Hydrochlorothiazide 12.5 mg daily.
4. Timoptic 0.5% eye drops one drop in each eye bid.
5. Latanoprost drops 0.005% one drop in each eye at bedtime.

This is based on the medication bottles that she brings in today which she did not have with her at her last visit a week ago.

ASSESSMENT/PLAN:
1. Anticoagulation with good INR control. She should come in for a value just before she leaves for France and then return to see me after that.

2. Travel to France. She is looking forward to travel. She is currently doing well and I believe can safely travel to France. She does have chronic problems with imbalance and should be sure to take her cane with her. She has fortuantely not had any recent falls.

We provided some refills of her medications and she will need to obtain two months supply of all her medications when she is in France for six weeks. When she returns she will be due for a visit as well as for lipid panel with LFT in addition to her INR. She also needs a followup appointment with Dr. Zierler which she has not scheduled yet in Vascular Clinic.

FAMILY MEDICINE CLINIC NOTE

PROBLEM: Anticoagulation for recurrent DVT of lower extremities.

SUBJECTIVE: The patient has been on stable dose of Coumadin listed below. No difficulties with bleeding. Her INR one month ago was 2.5 and since November has been in the 2-3 range. Her INR today, however is 1.42. She denies changing her medications or changing her diet.

PROBLEM: Hypertension.

SUBJECTIVE: At her last visit with Allan Ellsworth she was begun on hydrochlorothiazide 12.5 mg bid for blood pressure control. However, it does not appear that she has started this.

PROBLEM: Hyperlipidemia.

SUBJECTIVE: Her last lipid panel is as described below. Dr. Ellsworth advised that she increase atorvastatin from 20 mg to 40 mg daily; however, she has just gotten this prescription filled and wanted this to be reviewed by me before starting this medication. She has had no difficulties with muscle soreness or any elevated liver function tests while on atorvastatin 20 mg daily.

PAST MEDICAL HISTORY:
1. Seizure disorder, petty mal seizures since 1975. No recent seizures. Is on Tegretol 20 mg bid, stable dose.

2. History of reflux esophagitis for which she is on Prilosec which she is just needing to take prn presently.

3. Bilateral sensory neural hearing loss since 1982.

4. Recurrent phlebitis and DVTs since 1982.

5. Status post hysterectomy in 1971 for fibroids and also had bilateral salpingo-oophorectomy at the time.

6. Hypercholesterolemia.

7. Status post carpal tunnel release in 1989 on the right side.

8. Positive PPD with negative chest x-ray in 1981.

9. Allergic rhinitis.

10. DJD of LS-spine by x-ray in 1994.

11. Bilateral talonavicular arthritis 1994.

12. Right patellar fracture 1995.

13. Osteoporosis prevention. She is due for repeat bone density study in 2005. She is on calcium carbonate and vitamin D at doses listed below.

14. Glaucoma followed by ophthalmologist.

15. Hypertension. Recently begun on hydrochlorothiazide as described above, though it is not clear that she is taking this medication.

CURRENT MEDICATIONS:
1. Atorvastatin 20 mg qhs which was recently increased to 40 mg by Allan Ellsworth, MD. She will begin this shortly.

2. Coumadin 10 mg on Monday, Wednesday, Friday and Sunday, and 5 mg on Tuesday and Thursday which is a stable dose for her for sometime.

3. Tegretol 200 mg bid.

4. Trental 400 mg daily.

5. Acetaminophen prn.

6. Prilosec 20 mg prn.

7. Calcium carbonate 1000-1500 mg daily.

8. Vitamin D 400 international units daily.

9. Hydrochlorothiazide 12.5 mg bid which is not clear if she is taking.

10. Rofecoxib 12.5 mg daily.

11. Timoptic 0.5%.

12. Latanoprost drops in both eyes at bedtime.

HEALTH MAINTENANCE: Her last mammogram was in December of 2003 and was unremarkable. Hemoccults August of 2003 were unremarkable as well. Blood pressure and cholesterol as noted above. Sigmoidoscopy in May of 2001 was negative to 30 cm. Hemoccults have repeatedly been negative.

SOCIAL HISTORY: Lives alone on Bainbridge Island. Her son has faxed me requesting a copy of her medical record to be provided to the patient as they are planning a trip to Paris which they have been saving up for for five years. In the last few years Mrs. Hoffman has been fortunate enough to have her son take her on an annual trip, usually by railroad. She enjoys these greatly.

REVIEW OF SYSTEMS: She has previously been cared for by Dr. Strandness in Vascular Surgery, but is transferring care to Dr. Zierler after the death of Dr. Strandness. She will schedule a followup appointment there later this spring.

OBJECTIVE: VITAL SIGNS: Weight 160, blood pressure 140/80, pulse 80 and regular. GENERAL: The patient appears in good spirits. Her gait, as usual, is quite unsteady which has been true for many years. Fortunately she has not experienced any falls. She does use a cane. CHEST: Clear as are her lungs. EXTREMITIES: She has chronic venous stasis changes in her lower extremities.

LABORATORY: INR today was 1.42, but previous values have been in the therapeutic range as described above. Her lipid panel in December of 2003 showed an LDL of 48, HDL 62, triglycerides 201. This was on atorvastatin 20 mg daily which has since been increased.

ASSESSMENT AND PLAN:
1. Recurrent deep venous thromboses (DVTs). She is to continue medications listed above. Her INR is unexpectedly low today. Would recheck this in one week without dosage adjustment presently. Once she returns from France, she should schedule followup in Vascular Surgery with Dr. Zierler.

2. Hypertension. She is to bring in all of her medications next week so we can see if she is taking hydrochlorothiazide. We will check basic metabolic panel assuming that she is taking the hydrochlorothiazide in order to recheck her potassium and renal function.

3. Hyperlipidemia. She is to increase her atorvastatin to 40 mg qhs. Side effects discussed. Report any muscle soreness. Followup lipid panel and liver function tests (LFTs) after six weeks on this medication.

4. Planned travel to Paris with her son. I will provide a copy of this visit to the patient at her next visit.

5. Osteopenia. Continue vitamin D and calcium carbonate. She has not been a candidate for Fosamax because of her problems with gastroesophageal reflux disease (GERD). She is due for bone density study in 2005.

PROBLEM: MEDICATION REFILL.

SUBJECTIVE: Received medication refill from the patient's pharmacy today requesting Lipitor 20 mg daily. There is a handwritten note in the chart from Dr. Ellsworth to increase her Zocor (not Lipitor) to 40 mg daily. It is noted that her last LDL level was 148 in December. Because of this the pharmacy is requested to refill atorvastatin at a dose of 40 mg daily.

ASSESSMENT/PLAN: Authorization given for #30 with one refill.

PROBLEM: PERIPHERAL VASCULAR DISEASE, LONG-TERM ANTICOAGULATION, HYPERTENSION.

SUBJECTIVE: Patient returns primarily for anticoagulation monitoring and management. We have also been paying attention to gradually increasing blood pressures. Patient has been having no difficulties with her medications or medical problems. Denies bruising, bleeding, signs and symptoms of thromboembolic event.

She does have a problem with her right hip and right knee. She describes the pain as pinching. Comes on with certain positions. Her right knee hurts when she walks too far. She received some benefit from the rofecoxib regarding this pain. No stomach upset.

Denies headache, chest pain, shortness of breath, or palpitations. She also complains of some pain in her lateral distal thigh just above the knee joints. Is not hot, warm, just tender to palpation and corresponds with varicose veins.

WORKING PROBLEM LIST INCLUDES:
1. Peripheral vascular disease.
2. Gastroesophageal reflux disease.
3. Hypertension.
4. Hypercholesterolemia.
5. Osteoarthritis.
6. History of seizures.
7. History of glaucoma.
8. Osteoporosis.

CURRENT MEDICATIONS:
1. Warfarin 10 mg Monday, Wednesday, Friday; Sunday 5 mg Tuesday and Thursday (45 mg per week).

2. Omeprazole 20 mg qd.

3. Rofecoxib 12.5 mg qd.

4. Atorvastatin 20 mg qd.

5. Pentoxifylline 400 mg daily.

6. Carbamazepine 200 mg bid.

7. Latanoprost ophthalmic drops one drop both eyes at bedtime.

8. Timoptic 0.5 mg a drop both eyes twice daily.

9. Calcium plus vitamin D two or three tablets a day.

10.Multivitamin one tablet a day.

OBJECTIVE: GENERAL: Pleasant, alert, elderly woman in no acute distress. VITAL SIGNS: Weight 162 (up 3), height 5'3", blood pressure 156/86, pulse 68. CHEST: Clear to auscultation bilaterally. HEART: Regular rate and rhythm. Normal S1 and S2. LOWER EXTREMITIES: Edema 1+.

LABORATORY: Prothrombin time as INR 2.4.

ASSESSMENT: Elderly lady with multiple medical conditions, mostly stable. Probably continues independent living, planning a trip to France with her son.

1. Anticoagulation. Stable on current dose of Coumadin.

2. Hypertension. Because SHE HAS A HISTORY OF SULFA ALLERGIES probably reasonable to initiate hydrochlorothiazide as a small crossover. She is aware of the side effects to watch for.

3. Hip pain. Probably osteoarthritis.

4. Varicose veins. Given her extensive peripheral vascular disease and previous history I am not sure that much can be done about further more proximal varicose veins. It has been some time since she visited with Vascular Surgery (Dr. Zierler). Previously followed by Dr. Strandness, is retired. She is quite unstable on her feet with a fall risk. I wonder if it would be more appropriate to consider other pharmacotherapy for protection rather than Warfarin. Will discuss next time to evaluate the varicose veins. This probably needs to be worked with her primary care physician, Dr. Neighbor, for referral.

PLAN:
1. Continue Warfarin, same dose. Return for recheck one month.

2. Initially hydrochlorothiazide 12.5 mg bid. Electrolytes to be rechecked at followup visit.

3. Discuss referral to Vascular Surgery with Dr. Neighbor and then consider referral to Dr. Eugene Zierler.

PROBLEMS:
1. ANTICOAGULATION.
2. GASTROESOPHAGEAL REFLUX DISEASE.
3. HYPERTENSION.

SUBJECTIVE: The patient returns primarily for prothrombin time monitoring. At her last visit, she was a little supertherapeutic, and a small dosage change was implemented. She is currently taking 10 mg Monday, Wednesday, Friday and Sunday, 5 mg on Tuesday, Thursday, and Sunday (55 per week). No bruising, bleeding, thromboembolic problems. She is having difficulty with heartburn and reflux disease. She has run out of pantoprazole about a week ago, and has been using sodium bicarbonate, and eighth to a quarter of a teaspoonful twice daily. Tums do not help. The proton pump inhibitors completely keep this away. She would also like to refill her rofecoxib, which she takes fairly regularly, but not every day for foot pain, and it does not upset her stomach as other nonsteroidal anti-inflammatories do.

OBJECTIVE: Pleasant, elderly woman in no acute distress; continues to be ustable when walking. VITAL SIGNS: Weight 159 (up 4), blood pressure 164/84, pulse 78. CHEST: Clear to auscultation bilaterally. HEART: Regular rate and rhythm. Normal S1, and S2 without extra sounds. LOWER EXTREMITIES: 1+ edema bilaterally.

LABORATORY: Prothrombin time as INR, 2.4.

ASSESSMENT: Adequate anticoagulation without complications or problems on 55 mg per week dose. Gastroesophageal reflux disease with symptomatic relief with sodium bicarbonate, probably an effect of blood pressure, plus or minus weight, plus or minus leg edema. History of osteoporosis with a negative 2.09 T-score at the hip, but GERD complicates thinking about bisphosphonates. She is taking calcium 600 mg with vitamin D once daily (Costco preparation).

PLAN:
1. Continue calcium, vitamin D, but increase to two tablets daily.

2. Change pantoprazole to omeprazole.

3. Continue Coumadin same dose.

4. Recheck in one month. If blood pressure persists elevated, will need to initiate therapy at next visit.

PROBLEM: ANTICOAGULATION.

SUBJECTIVE: Patient returns for routine prothrombin time monitoring. She had her dosage increased from 55 to 60 mg a week a couple of weeks ago by Dr. Kelley Kennedy. She has not changed other medications at all. Via her memory, pretty compliant to the regimen of 10 mg on Monday, Wednesday, Friday, Saturday and Sunday; 5 mg on Tuesday and Thursday. No complaints of bruising, bleeding or signs or symptoms of thromboembolic disease.

OBJECTIVE: Prothrombin time is INR 3.6.

ASSESSMENT: Supratherapeutic anticoagulation without complications or problems.

PLAN: A 10% dose reduction (60 to 55 mg per week) as 10 mg Monday, Wednesday, Friday and Sunday; Tuesday, Thursday and Saturday 5 mg. To recheck in two weeks.

CHIEF COMPLAINT: FOOT PAIN.

HISTORY OF PRESENT ILLNESS: Jeanne came in today to have her INR checked as she has been on long-standing Coumadin for deep vein thrombosis. When she came in for this, she was also complaining of some pain in her foot. She describes it as pinching sensation that comes and goes. It is in all different parts of the foot. She is not really sure what it is associated with. She denies trauma and is not having the pain at this point. Most recently she was seen here on August 1 at which time her INR was low at 1.9. At that time, her Warfarin was increased by 5 mg per week. She is here today for recheck.

CURRENT MEDICATIONS
1. Atorvastatin 20 mg po qd.
2. Omeprazole 20 mg po qd.
3. Pentoxifylline 400 mg three times a day.
4. Carbamazepine 200 mg three times a day.

OBJECTIVE: Vital signs are stable. Exam of her right foot reveals a normal appearing foot without swelling. She has no areas of tenderness including all joints and the ankle.

LABORATORY: INR 1.4.

ASSESSMENT: Subtherapeutic anticoagulation. Right foot pain of unknown etiology.

PLAN: We will again increase her Warfarin so that she is taking 10 mg Monday, Wednesday, Friday, Saturday, and Sunday; 5 mg Tuesday and Thursday. She will return to clinic in two weeks to have this rechecked. I reassured her that her foot would probably improve on its own and it is unclear what this pain would be. She was also encouraged to get an appointment with Dr. Neighbor for regular followup.

Patient was discussed with Dr. Sharon A. Dobie.

DOB: 1/6/1925
DOS: 8/1/2003

PROBLEM: ANTICOAGULATION.

SUBJECTIVE: Follow-up visit to assess safety and efficacy of anticoagulation. She recently returned from a prolonged vacation. On this vacation, she slipped, fell, hurt her back, and ended up with a hospitalization in New York because of hematuria. Subsequently, cleared without reversal of her anticoagulation. When she returned to follow up, she had an elevated prothrombin time. A slight reduction in prothrombin time was made (60 mg a week to 50 mg a week). She is here today for followup. Denies bruising, bleeding, addition of new medications, signs and symptoms of thromboembolic events. She does complain of being cold (something she frequently does when her prothrombin time is low). She also seems quite unstable on her feet. This is not new, but given the recent fall and her instability to stand upright without holding onto a cane or the wall, further assessment was done.

CURRENT MEDICATIONS: Other medications are unchanged, including:
1. Atorvastatin 20 mg qd.

2. Omeprazole 20 mg qd.

3. Pentoxifylline 400 mg three times a day.

4. Carbamazepine 200 mg three times a day (therapeutic carbamazepine level within the past several months).

OBJECTIVE: VITAL SIGNS: Weight 155 lb (down 6 lb), blood pressure 134/76, pulse 78.
NEUROLOGIC EXAM: Alert and oriented times two. Normal motor strength in all groups. Normal sensation grossly. Deep tendon reflexes 2+ symmetrically, except no patellar reflex or Achilles on the left. Positive Romberg.

LABORATORY: Prothrombin time is INR 1.9.

ASSESSMENT: Subtherapeutic anticoagulation, balance problems, with symmetric screening neurologic exam.

PLAN: Increase warfarin 5 mg per week (55 mg per week), as 10 mg Monday, Wednesday, Friday,

and Sunday, 5 mg the rest of the days. Return in one month for recheck. Encouraged the patient to follow up with Dr. Neighbor, her primary provider, regarding alternative source for balance problems.

PROBLEM: ANTICOAGULATION.

SUBJECTIVE: The patient has finally returned from extended vacation/road trip with her son. Drops by today to have a prothrombin time checked. Unfortunately, on her vacation she slipped and fell backwards down stairs. Several days later, she noted hematuria. Subsequently, was hospitalized. No changes in her medication regimen that she is aware of.

Has returned home now approximately five days post hospitalization and resumed her usual medications:

1. Atorvastatin 20 mg qd.

2. Omeprazole 20 mg qd.

3. Pentoxifylline three times a day.

4. Carbamazepine 200 mg tid.

5. Warfarin 10 mg daily except for Tuesdays and Thursdays when she takes 5 mg.

Hematuria has cleared. Has noted no other bruising or bleeding.

OBJECTIVE: Prothrombin time: His INR 3.3.

ASSESSMENT: Supratherapeutic anticoagulation post a fall with subsequent hematuria and hospitalization.

PLAN: A 10% to 15% reduction in prothrombin time from 60 mg a week to 50 mg a week; as 10 mg Monday, Wednesday and Friday, 5 mg the rest of the days. Return in two weeks for recheck for stability. Follow up on injury. We will try to obtain records before then.

ANTICOAGULATION.

The patient has gone on vacation and told Dr. Neighbor she would have prothrombin time results forwarded to the clinic. Per Dr. Neighbor, no results have been received. I have been calling the patient's home weekly to remind her to get her prothrombin time checked, in the hopes that she might check phone messages. Her phone rings, then beeps without an outgoing message, and I am not sure whether these messages are even being recorded. I will continue attempting to reach the patient weekly until I complete my residency at the end of the month. Dr. Neighbor has been notified.

FAMILY MEDICINE CLINIC NOTE

PROBLEM: Status post fall.

SUBJECTIVE: She slipped on the wet kitchen floor on March 15, sustaining contusions to her arms, abdominal wall, and legs for which she reports being seen at another health care facility. There was no evidence of fracture. Patient continues to feel sore but feels that she is gradually improving. She continues to have problems with steadiness of her gait and uses a cane and most of the time does so safely.

PROBLEM: UTI.

SUBJECTIVE: Incidental finding at the physician's office where she was seen, which was Jared Hendler on Bainbridge Island, was urinalysis positive for nitrates and leukocyte esterase with wbc's and bacteria present without blood. She reports she was just given the result but was not treated.

PROBLEM: Travel.

SUBJECTIVE: Her son, who two years ago took her on a long trip, is now taking her on a long trip again on train to the midwest and the east for a family reunion. She will be gone for two to three months. She needs a refill on her medications.

PAST MEDICAL HISTORY:
1. Seizure disorder.
2. Reflux esophagitis.
3. Hearing loss.
4. Hypercholesterolemia.
5. Venostasis ulcers and peripheral vascular disease.

CURRENT MEDICATIONS:
1. Atorvastatin 20 mg qd. At her last visit we had advised increasing it to 30 mg qd, but she found this too expensive and so has stayed at 20 mg qd.

2. Coumadin 10 mg qd except 5 mg on Thursdays and Sundays.

3. Tegretol 200 mg tid.

4. Trental 400 mg tid.

5. Prilosec 20 mg prn.

6. Calcium carbonate 1000 mg qd.

7. Vitamin D 400 IU qd.

8. Acetaminophen prn.

9. Elastic stockings.

REVIEW OF SYSTEMS: She also has osteoporosis, and we have described before the risks of treating her with Fosamax given her history of GERD.

OBJECTIVE: VITAL SIGNS: Weight 161, blood pressure 158/80 and on repeat 140/80, pulse 74 and regular. MUSCULOSKELETAL: Exam of her upper arms shows
some diffuse tenderness in the upper arms but no deformity or ecchymoses. She also has some diffuse tenderness over her spinal muscles in her back and an area of point tenderness over the left superior iliac crest without swelling, ecchymosis, or deformity. She does not have any significant tenderness today in the lower extremities. She does wear her elastic stockings.

LABORATORY: This March an M7 was unremarkable except for a glucose in the afternoon of 132 at 3:30 PM which was probably normal. CBC normal. Tegretol level 7.4 which is within therapeutic range. INR done two weeks ago was 2.0, stable. Patient has not had a lipid panel with LFTs which was advised at her last visit with me in October, and has not returned Hemoccult cards or had colonoscopy or sigmoidoscopy which had been advised at that visit. Her mammogram was negative in October 2002.

ASSESSMENT AND PLAN:
1. Status post fall in her kitchen in patient who has unsteady gait but is using a cane and usually is able to get around safely. I do not find any evidence today of significant sequelae from this. She should continue to improve.

2. Asymptomatic urinary tract infection. Will treat with ciprofloxacin 500 mg bid times three days.

3. Planned family trip. A medical history written two years ago was updated today, and an original

and a copy is given to her to take with her in case she needs medical attention. It includes an updated medication list.

4. Hypercholesterolemia. Continue atorvastatin at current dose. As she will not be returning until August, she should have fasting lipid panel with LFTs done at that time.

5. Osteoporosis. She should continue calcium and vitamin D supplementation. Previous plan had been repeat bone density in 2005.

6. Breast cancer screening. Negative mammogram, October 2002.

7. Colorectal cancer screening. Hemoccult kit given again. Advised sigmoidoscopy or colonoscopy.

8. Anticoagulation. Due for INR in two weeks at which time she will be on her trip. Two years ago when she went on a trip, she would stop periodically at hospitals to have her INR checked. This seems like a satisfactory plan this time as well.

DOB: 1/6/1925
DOS: 3/17/2003

PROBLEM: DIZZINESS, RECURRENT DVT/PHLEBITIS, CHRONIC ANTICOAGULATION.

SUBJECTIVE: Patient returns with chief complaint of dizziness and unsteadiness on her feet. Says she had a fall on Sunday, falling to her left side, bruising her left arm, left hip, and left buttocks and abrading her left arm with a superficial scratch. Her son has just come home to visit. Took her to see his physician. Blood work was drawn, evaluation was done. No changes were made in her medications. She is scheduled today to follow up on her anticoagulation for multiple recurrent DVTs/phlebitis and chronic anticoagulation with a goal of 2 to 3. She denies any additional bleeding, blood in urine, blood in stool, signs and symptoms associated with phlebitis and/or a stroke. She continues to have intermittent problems with numbness on her left side (see emergency note from about a month ago).

Her ongoing medical problems are much the same:
1. Significant peripherovascular disease, recurrent DVT.
2. Long-term anticoagulation.
3. Seizure disorder on the carbamazepine (last level measured in September was 8.3).
4. Decreased hearing.
5. Dyslipidemia.
6. History of positive PPD status post chemotherapy.
7. Chronic low back pain.

MEDICATIONS: Medications were reviewed:
1. Warfarin 10 mg daily, except for Tuesday and Thursday 5 mg.
2. Carbamazepine 200 mg tid.
3. Pentoxifylline 400 mg tid.
4. Rofecoxib 12.5 mg qd.
5. Pantoprazole 40 mg qd.
6. Atorvastatin 20 mg qd.

OBJECTIVE: GENERAL: A pleasant elderly woman, quite unsteady on her feet, staggers down the hall and into the exam room, but not frustrated or in acute distress with the dizziness. VITAL SIGNS: Weight 164, blood pressure 130/80, pulse 76 by the medical assistant. Orthostatic blood pressures 10 or 15 minutes later: sitting 140/70, pulse 72; standing, with time for equilibration, 150/80, pulse 72. HEENT: Normocephalic, atraumatic. Extraocular

movements intact. Pupils equal, round, and react to light. No facial asymmetry. Remaining cranial nerves intact. EARS: Tuning fork lateralized to the left ear. Air conduction was better than bone bilaterally. Decreased auditory acutiy bilaterally to gross testing. External auditory canals clear. Tympanic membranes visualized. Normal landmarks. CHEST: Clear to auscultation bilaterally. HEART: Regular rate and rhythm. No additional sounds. SKIN: A 3 to 5 cm bruise on her left arm. A 17 cm, very superficial scratch on her left posterior forearm. A 17 cm long-thin hematoma on her left posterior hip, and a 16 x 10 round hematoma/bruise on her left buttocks. NEURAL: Motor strength 5/5 and symmetrically in all groups. Deep tendon reflexes 2+, symmetrical except right patella. Achilles bilaterally were unobtainable. (Could not distract or get her to relax). Decreased sensation sharp to dull in left deltoid area; positive Romberg.

LABORATORY: Prothrombin time: INR 2.04.

ASSESSMENT: 1)Dizziness. Etiology unknown. Nothing focal. 2) Recurrent DVT. Asymptomatic. 3)Long-term anticoagulation with therapeutic prothrombin time. Clearly in "harm's way."

PLAN:
1. Continue warfarin 10 mg daily, except 5 mg on Tuesday and Thursday. Recheck in one month.

2. Labs: CBC, fecal occult blood, basic metabolic profile, with a carbamazepine level looking for generalized CNS unstabilizer.

3. Return to see Dr. Neighbor. Follow up on dizziness and lightheadedness.

ALLAN J. ELLSWORTH, PHARMD, PAC
CLINICAL PHARMACIST, DEPARTMENT OF FAMILY MEDICINE, Box #354775

DD: 03/17/2003
DT: 03/18/2003

PT NAME: HOFFMAN, JEANNE L
NUMBER: U 8-17-01-35
DOB: 1/6/1925
DOS: 2/10/2003

PROBLEM: RECURRENT DVT/Phlebitis, CHRONIC ANTICOAGULATION.

SUBJECTIVE: The patient returns for routine prothrombin time monitoring. Has had no complications or problems associated with anticoagulation. Denies bruising or bleeding. She continues on her routine warfarin regimen of 10 mg daily except for Tuesdays and Thursdays when she takes 5 mg. She has not missed any doses. She did have a brief emergency room visit not long ago for a peripheral numbness sensation on her left side. The emergency room could not find any abnormalities. The work-up at that time included CT scan.

She did not take the aspirin that was offered because of her understanding of warfarin and aspirin interaction. She was advised to return to see Dr. Neighbor. Most of the numbness has resolved, but she does have a band of numbness around her left leg. It is not associated with any changes in strength, range of motion or function; it seems to be brought on primarily by walking. It is not there all of the time. She has not had any visual changes, unilateral weakness, dysarthria, etc.

OBJECTIVE: Weight 166, blood pressure 140/80, pulse 68. Prothrombin time, as INR 1.89.

ASSESSMENT: Anticoagulation for recurrent DVT/phlebitis in a patient with known peripheral vascular disease. She takes a number of other medications, namely anticonvulsants, pentoxifylline, atorvastatin, pantoprazole, rofecoxib. Review of her prothrombin times for the last six months have fluctuated between 1.8 and 2.9 without any change in dose. Prothrombin time in the emergency room a week or so ago on the same dose was 3, and so I am not prone to want to change the dose at this time. Prudent to obtain fecal occult blood monitoring and CBC given her concomitant NSAID on a semi-regular basis.

PLAN: 1) Continue warfarin as above at the same dose.
2) Medication refill through September.
3) CBC and fecal occult blood tests next month.
4)
Return to Dr. Neighbor for primary care.

EMERGENCY MEDICINE SERVICE NOTE

TIME SEEN:
1108 hours.

CHIEF COMPLAINT:
Left-sided numbness for two weeks.

HISTORY OF PRESENT ILLNESS:
Ms. Jeanne Hoffman is a pleasant 78-year-old Caucasian female who comes to the University of Washington Emergency Room with a complaint of left-sided numbness both of upper extremity, trunk, and lower extremity for two weeks. She reports she could not feel the toilet seat this morning with the left side of her body, and that is what scared her and prompted her to come in. She denies speech changes or facial droop. No problems with thought process. She denies any motor deficits. She denies any visual changes, headache. She denies any shortness of breath, chest pain, palpitations, nausea or vomiting. She denies any visual changes. Patient has no history of this numbness or tingling in the past. She has a normal widebased gait which has remained wide-based and has not changed from her baseline. She denies any fevers, chills, cough, cold, runny nose, GI or GU complaints.

REVIEW OF SYSTEMS:
As per HPI. All other systems noncontributory.

CURRENT MEDICATIONS:
1. Lipitor.
2. Coumadin.
3. Trental.
4. Tegretol.

ALLERGIES:
NO KNOWN DRUG ALLERGIES.

PAST MEDICAL HISTORY:1. Significant for peripheral vascular disease, recurrent deep venous thrombosis on long-term anticoagulation.

2. Seizure disorder.

3. Reflux esophagitis.

4. Decreased hearing.

5. Hyperlipidemia.

6. History of positive PPD status post treatment.

7. Chronic lower back pain, with an MRI in 2001 demonstrating degenerative disk disease from L1 through L5.

FAMILY HISTORY:
Noncontributory.

SOCIAL HISTORY:
Patient denies smoking, drugs, or alcohol. She denies any recent travel. She is retired and lives here in Seattle with family in the area.

VITAL SIGNS ON PRESENTATION:
Blood pressure 163/90, temperature 36, pulse 82, respirations 16, O2 saturation 98% on room air. GENERAL APPEARANCE: This is a well-developed, well-nourished Caucasian female in no apparent distress sitting in bed smiling. HEENT: Normocephalic, atraumatic. Extraocular movements intact. Pupils equal, round, and reactive to light. No facial asymmetry noted. Cranial nerves intact. Fundus is clear without papilledema NECK: Supple, with full range of motion. There were no carotid thrills or bruits and no JVD noted on neck exam. There were no thyroid masses or nodules noted on neck exam. BACK: There was no tenderness to palpation noted over cervical spine, thoracic spine, or lumbar spine. LUNGS: Clear to auscultation bilaterally, with no wheezes or rales heard. HEART: Regular rate and rhythm, with no murmurs, rubs, or gallops. ABDOMEN: Soft, nontender, nondistended, with normoactive bowel sounds. No masses, guarding, or rebound noted on abdominal exam. GENITOURINARY and RECTAL EXAM: Refused by patient. EXTREMITIES: Full range of motion throughout, with no crepitus, laxity, or obvious form of injury to the extremities. SKIN: No ecchymosis or bruising. NEUROLOGIC: Cranial nerves III through XII intact, with sensation intact tolight touch throughout except for the left upper extremity. Patient had decreased sensation to light touch in the left upper and left lower extremity as well as left trunk as well as

decreased sensation to pinprick in those same areas. Patient had good distal pulses throughout, 2+ throughout. Had 2+ deep tendon reflexes, symmetric through. Downgoing toes bilaterally. Patient had normal finger-to-nose and heel-to-shin bilaterally, with normal speech.

LABORATORY TESTS:
While in the Emergency Room, patient had an IV placed and had several labs drawn.

Chemistry panel: Sodium 145, potassium 4.3, chloride 108, bicarbonate 26, BUN/creatinine of 13.7, with glucose of 126.

White count 5.83, hematocrit 39, platelets 214, calcium 9, PT 13.5, PTT 34, INR 3.0.

A head CT was performed which demonstrated no acute intracranial
bleed, no masses, no midline shift. There is evidence of old lacunar infarcts, but no change from previous studies.

EMERGENCY DEPARTMENT COURSE:
The patient was seen and examined with Dr. Tolson. She was provided with an aspirin. While in the Emergency Room, the patient was seen and examined by Neurology, Dr. Oakley. Please refer to his note for further details. It was felt that the patient had paresthesias of unknown etiology. It was not thought to be of a cerebrovascular etiology. The case was discussed with Dr. Oakley and Dr. Neighbor (the patient's Family Medicine doctor). All were in agreement with the treatment and follow-up plan for this patient.

FINAL DIAGNOSIS:
Paresthesia of uncertain etiology.

PLAN & FOLLOW UP:
The patient will follow up in Family Medicine Clinic with Dr. Neighbor. The patient was instructed to return for worsening of symptoms, chest pain, weakness, or any other concerns she may have. She and her family were amenable to the treatment plan. All questions were answered.

DISCHARGE CONDITION: Satisfactory.

PETER CUENCA, MDRESIDENT

PC[15:28]:01/17/2003jm[16:11]:01/17/2003led/mmf:01/17/2003(16:45)

PT NAME: HOFFMAN, JEANNE L
NUMBER: U 8-17-01-35
DOB: 1/6/1925
DOS: 12/4/2002

PROBLEM: PERIPHERAL VASCULAR DISEASE, RECURRENT DEEP VEIN THROMBOSIS, LONG-TERM ANTICOAGULATION.

SUBJECTIVE: Patient returns primarily for prothrombin time monitoring. She continues on her warfarin, taking 10 mg most days, except Tuesday, Thursday, and Sunday, when she takes 5 mg. She has had no difficulty with bruising, bleeding, blood in urine, stool, or signs or symptoms associated with thromboembolic disease.

Her other medical problems include:
1. SEIZURE DISORDER.
2. REFLUX ESOPHAGITIS.
3. DECREASED HEARING.
4. HYPERCHOLESTEROLEMIA.
5. HISTORY OF POSITIVE PPD.
6. CHRONIC LOW BACK PAIN.

MEDICATIONS:
1. Atorvastatin 20 mg qd.
2. Warfarin, as above.
3. Carbamazepine 200 mg tid.
4. Pentoxifylline 400 mg tid.
5. She has also been taking acetaminophen a gram two or three times a day along with 200 mg of ibuprofen two or three times a day for the back pain.

She knows that ibuprofen can be a little bit risky with her Coumadin and other gastrointestinal complaints, but her back pain has really been bothering her lately. She is able to walk across the room without any difficulty, although she favors her left foot. She has pretty good flexion. She can touch her toes without difficulty, extension, lateral flexion. She can get her fingertips to her knees. Primarily when she walks, it hurts. The pain is not in her hip or her spine. There is no tenderness there. She has noted scoliosis, but palpation of her lumbosacral muscles in the L2 to L5 on the left side causes most of the pain. This hurts when she walks. Sitting does not cause much difficulty.

OBJECTIVE: Prothrombin time is INR 2.1.

An MRI from August 2001, the last time Dr. Neighbor evaluated her back, showed mild-to-moderate posterior disc bulging, osteophytes, and neuroforaminal narrowing in the L1 through L5 region.

ASSESSMENT: 1) Hypercoagulopathy, stable without complications or problems, long-term anticoagulation
stable without problems on current dose. 2) Low back pain with radiculopathy secondary to osteoarthritis.

PLAN: Continue warfarin at the same dose. Recheck in one month. Continue acetaminophen prn pain. Will add rofecoxib 12.5 mg qd gingerly to see if we cannot get some added relief at this point, without disrupting warfarin therapy.

DD: 12/04/2002
DT: 12/05/2002

PT NAME: HOFFMAN, JEANNE
NUMBER: U 8-17-01-35
DOB: 01/06/1925
DOS: 10/03/2002

Patient believed that she was here for a physical examination today, though was scheduled for just a 15-minute visit and had several specific problems that she wanted to follow up on.

PROBLEM: HYPERCHOLESTEROLEMIA.

SUBJECTIVE: Compliant with medications listed below and with diet. Denies side effects including muscle soreness. She recently had LDL cholesterol done and is in for review of results.

PROBLEM: SEIZURE DISORDER.

SUBJECTIVE: Compliant with medications. Recent Tegretol level done. No recent seizures.

PROBLEM: STATUS POST FALL.

SUBJECTIVE: See note dictated 9/25/2002 which describes the circumstances of her needing to crawl through the window and suffering some abrasions. There was actually no specific fall. Patient seems to be recovering satisfactorily.

PROBLEM: COUGH.

SUBJECTIVE: Patient has periodic cough which at one point seemed to improve with Protonix described at the visit 9/25/2002. However, now she describes recurrence of nonproductive cough without fever or chills, nightsweats or recent URI. There is no history of tobacco abuse, COPD, or asthma.

PROBLEM: HEALTH MAINTENANCE.

SUBJECTIVE: In for review of health maintenance needs.

PAST MEDICAL HISTORY:
1.Hypercholesterolemia.

2.Recurrent DVT for which she has been on chronic Coumadin therapy.

3.Seizure disorder with no recent seizure.

4.GERD.

MEDICATIONS:
1.Atorvastatin 20 mg qd.
2.Coumadin stable dose.
3. Tegretol 200 mg tid.
4.Trental 400 mg tid.
5.Elastic stockings.
6.Prilosec 20 mg qd.
7. Calcium carbonate 1000 mg qd.
8.Vitamin D 400 IU qd.

PHYSICAL EXAMINATION: TMs clear. Nose clear. Throat clear. NECK: Supple without adenopathy. CHEST: Completely clear to auscultation. COR: S1 and S2 normal without murmur, gallop, or rub. EXTREMITIES: With chronic venous stasis changes, but no acute changes.

Blood pressure 122/88, pulse 74 and regular.

LABORATORY: CBC
and liver function test unremarkable. Tegretol level 8.3, in therapeutic range. LDL cholesterol 143.

ASSESSMENT AND PLAN:
1.Hypercholesterolemia in a patient with peripheral vascular disease. Goal is to have LDL less than 100. Advance atorvastatin to 30 mg qd. Recheck lipid panel with LFTs in six weeks. She is to report any unusual muscle soreness.

2.Cough which initially seemed to be improved with Protonix, but now is a recurrent complaint per the patient today. I did not identify an acute cause for her cough. There was inadequate time in the 15 minutes available for complete exploration of the etiologies with her cough. She will follow up in six weeks.

3.Seizure disorder with no recent seizures and stable Tegretol level. Continue medication.
4.Colorectal cancer screening. Hemoccult kit given. Advised colonoscopy for more thorough colorectal screening; however, patient preferred sigmoidoscopy.

5.Breast cancer screening. A mammogram ordered. Return to clinic for breast exam.

6.Osteopenia without osteoporosis. Recent bone density study showed osteopenia, but not osteoporosis at the hip and spine. We will continue vitamin D and calcium supplementation. In view of her history of GERD, as well as her complicated other medication regimen and anticoagulation, I do not believe she is a good candidate for Fosamax. Would repeat bone study in 2005.

WEN[21:26]:10/07/2002fl[14:33]:10/10/2002

Patient: HOFFMAN, JEANNE LEONIE
MR#: U8170135
Visit: 09/25/2002
Dictator: ELLEN E RHINARD

RECURRENT DVT ON CHRONIC ANTICOAGULATION.

SUBJECTIVE: The patient returns for routine anticoagulation follow up. One or two weeks ago, she had to crawl into her home via a window and got bruises all over, mostly now healed. Her left leg still has a lesion but she is not in any pain. She denies any other unusual bleeding or bruising, as well as any shortness of breath or chest pain. Her diet and exercise have been consistent. Her medications have been consistent as follows.

1. Tegretol 200 mg tid.
2. Trental 400 mg tid.
3. Lipitor 20 mg qd.
4. Protonix 40 mg qd.

Although the patient has to get up in the night frequently to urinate, in general she has no complaints. She denies constipation or diarrhea. She still coughs at night sometimes but it does not bother her. She cannot say for certain whether the cough is better or worse since she restarted Protonix at her last visit.

OBJECTIVE:
VITAL SIGNS: Blood pressure 131/63. Heart rate 66. Weight 161 lb. PHYSICAL EXAMINATION: Patient is alert and pleasant, in no acute distress. Lungs are clear to auscultation bilaterally. She only coughs a couple of times during the breathing exam and in general does not appear to be coughing much. LOWER EXTREMITIES: Patient only removes her elastic stockings on the left leg. From the mid-shin down, prominent venous stasis discoloration. On the medial aspect a couple of inches up from the ankle, there is a 0.5 x 1 cm shallow ulcer. She is protecting it with a dry gauze pad only, which is held in place by her elastic stockings. There is no drainage, swelling, or red streaking, and the patient denies any pain in this area.

LABORATORIES: INR today 2.7.

ASSESSMENT: 1. Anticoagulation therapeutic (goal 2-3).
2. Abrasion, left leg; venous stasis; peripheral vascular disease. The patient's injury does not appear to be infected, but it is very slow to heal due to her venous

stasis.
3. Cough seems to have mostly resolved with the addition of Protonix.

PLAN:
1. Continue Warfarin at current dose.
2. Recheck ProTime in four weeks.
3. Patient understands the importance of watching for signs of infection at the site of her injury. However, her current program of showering daily and changing the gauze pads a couple of times a day is adequate.
4. An appointment with Dr. Neighbor was made for October 3, for her to have a general physical. He will also be able to address her leg injury or her cough if either of these problems still bothers her.
5. Gave patient laboratory slips for CBC and Tegretol level, as these labs have not yet been checked this year. The results will be reviewed at her appointment with Dr. Neighbor.

Visit: 08/27/2002
Dictator: ALLAN J ELLSWORTH

PROBLEM: RECURRENT DEEP VENOUS THROMBOSIS, CHRONIC ANTICOAGULATION.

SUBJECTIVE: Patient returns for monthly prothrombin time visit. She has no complaints or problems. Continues to take warfarin 10 mg each day except for 5 mg on Sunday and Thursday. No bruising or bleeding that cannot be explained. Denies thrombolic event, signs or symptoms of thromboembolic events. Does complain of some cough and some nearly nightly heartburn. Wonders if she could refill the medicine that DSHS does not pay for (omeprazole). She has been out for several months. Time frame on the cough corresponds with the time frame that she has been off medication. She denies any runny nose or stuffiness, fever, or other upper respiratory symptoms.

OBJECTIVE: Prothombine time is INR 1.9.

ASSESSMENT:
1. Recurrent DVT, on chronic anticoagulation, stable warfarin dosing without complications or problems.
2. Cough for the last two or three months without allergic or upper respiratory tract signs. Does correspond somewhat with her increasing GERD symptomatology.
3. GERD. Off omeprazole because the state will not reimburse. Has been using Tums, apparently not as successfully.

PLAN: Continue warfarin at the same dose (ie, 10 mg each day except for 5 on Sunday and Thursday) with no change in dosage. Recheck pro-time again in one month. Reinitiate proton pump inhibition with pantoprazole 40 mg qd, which the state will pay for. She is told that she should expect to have no symptoms, and then watch to see if the cough does resolve over time or develop into something more pulmonary or respiratory that we can deal with. Follow up in one month.

Dictator: ELLEN RHINARD, PHARM.D.

PROBLEM: ANTICOAGULATION.

S: The patient is on long-term anticoagulation for repeated thrombolic events. She denies any symptoms of unusual bleeding or bruising, as well as any symptoms of stroke or clots. She denies any changes in her medications and denies using any over-the-counter or herbal products. She says she currently takes 5 mg of warfarin on Sundays and Thursdays and 10 mg all other days. She notes that her back pain is bothering her and that 25 of her last 30 pain pills were stolen from her house recently.

O: 7/29 INR 2.4; 6/28 INR 2.9; 5/20 INR 3.1; 4/16 INR 2.5.

A: Anticoagulation is therapeutic in a relatively stable patient (goal 2 to 3).

P:
1. Continue warfarin at current dose.
2. Repeat protime in one month. The patient will make an appointment with Allan Ellsworth.
3. Patient will follow up with physician regarding pain.

OTOLARYNGOLOGY CLINIC NOTE

SUBJECTIVE:
Ms. Hoffman is a 77-year-old woman well known to our service for bilateral sensorineural hearing loss and hearing aids. She presents for concerns of fluctuating hearing in her left ear. She indicates she had an episode of blood drainage from the ear approximately one month ago with decreased hearing. Since that time she has had no significant drainage, and her hearing has returned to baseline. She indicates that she is using her right hearing aid with good results and that her batteries are lasting from one to two weeks. She has no alteration in her baseline tinnitus and no new vertiginous symptoms. History is otherwise unchanged.

PHYSICAL EXAM: HEENT: Ms. Hoffman has symmetrical facial movement, and cranial nerve VII appears intact. There is no spontaneous nystagmus noted. Bilateral microscopic examination of the ears is performed. The right ear canal and tympanic membrane are intact and healthy in appearance with an intact drum and aerated middle ear cleft. The left side again showed a clear external canal and an intact drum. There is a small monomeric segment but no perforation. The middle ear is air containing, and the drum is mobile.

ASSESSMENT:
Ms. Hoffman has no evidence of infection. The episode may have been a perforation secondary to an ear infection which has now resolved. She appears to be functioning well with her hearing aids and will contact us if she begins to require additional amplification. If that is the case, we will obtain a new audiogram.

FOLLOWUP RASH.

S: Jeanne is a 77-year-old woman who comes in to clinic to follow up on a rash on her leg that appeared a couple of weeks ago. When I initially saw her, it had a raised, scaly, hyperkeratotic appearance suggestive of a nonspecific eczematoid rash. She has been using triamcinolone cream on it over the last couple of weeks and reports now that the rash is decreasing in size and is no longer itchy. She is a little bit concerned that we have not provided her a definitive diagnosis, but is satisfied with the progress thus far.

O: Blood pressure 136/74, pulse 72. There are several hyperpigmented, flat, smooth spots on the right leg just distal to the knee. They appear to be uninfected and uninflamed.

A: Nonspecific eczematoid rash. I do not think there is any need to do a definitive diagnosis with tissue biopsy, given the nice response to steroid medication.

P: The patient will continue use of steroids on a twice-daily basis over the next couple of weeks. If the rash fails to improve completely or flares again once she discontinues the steroid cream, then I think maybe a biopsy would be in order at that time.

TITLE: DERMATITIS.

S: Jeanne is a 77-year-old woman with multiple medical problems including seizure disorder, reflux esophagitis, recurrent DVTs, PENICILLIN ALLERGY, SEPTRA ALLERGY, and a not specified psychological disorder among other problems.

She comes in today because for the last week, she has been developing itchy, raised, scaly lesions on her leg. They have not been painful but they have been itchy and oozed a clear-looking fluid. She has been using antibiotic ointment on them without any improvement. Otherwise, she denies any systemic symptoms such as fever, malaise, muscle aches, etc.

O: Blood pressure 150/86, pulse 78, weight 159 lb. In general, a healthy-appearing elderly woman. Inspection of the legs reveals extensive stasis dermatitis over the shins and ankles. There is also diffuse shiny, atrophic skin and xerosis. There are multiple discrete, raised, hypertrophic plaques and papules measuring approximately 3 to 5 mm in diameter over the right leg below the knee. The number of these is probably six to eight total. Several of these lesions have a discharge of a clear solution. There is no tenderness to them, no erythema. No warmth. Otherwise, the skin exam is normal.

A: This is a nonspecific-appearing dermatitis that is unclear in origin, possibly an insect bite versus some sort of eczematous reaction.

P:
1. Obtained a viral skin culture for herpes, given the clear fluid discharge suggestive of ruptured vesicles.
2. Triamcinolone topical 0.1% cream.
3. Return to clinic in one week for re-examination.

PROBLEM: HYPERCHOLESTEROLEMIA.

SUBJECTIVE: Compliant with atorvastatin and diet. In for test results.

PROBLEM: FRACTURES.

SUBJECTIVE: See last clinic note. Plan had been to obtain bone density study. We did discuss vitamin D and calcium supplementation. MEDICATIONS:
1. Atorvastatin 20 mg qd.
2. Tegretol 200 mg tid.
3. Trental 400 mg tid.
4. Elastic stockings.
5. Prilosec 20 mg qd.
6. Vitamin C and calcium supplementation uncertain dose.

OBJECTIVE: Weight 160, blood pressure 144/80, pulse 64 and regular.

LABORATORY: Lipid panel: Total cholesterol 239, triglycerides 235, HDL 66, LDL 126.

ASSESSMENT/PLAN:
1. Hypercholesterolemia, well-controlled in patient without history of coronary heart disease. Continue atorvastatin. Recheck lipid panel with LFT in six months as her level prior to this most recent one had shown LDL elevated above 150.
2. History of fractures. Advised vitamin D 400 IU qd, and calcium 1000 mg qd. Advised bone density study, which was ordered.
3. Colorectal cancer screening. Review of her records shows that she had a limited sigmoidoscopy a year ago and recommendation was for repeat study this year, in particular for colonoscopy. She does not want to schedule this right now and we will discuss this with her at her next visit. She is also due for a breast examination this summer, and decision as to when to repeat her mammogram with her last study having been one year ago.

VASCULAR SURGERY OUTPATIENT CLINIC NOTE

This patient returns to the Vascular Surgery Clinic for ongoing care of her lower extremity post-thrombotic syndrome. She has been followed in this clinic for over 20 years. She has chronic venous insufficiency involving both lower legs, with resulting subcutaneous induration and pigmentation. She has a history of ulceration in the past, although she currently has no open ulcers. She is using Jobst support stockings. She states that her chronic venous disease is relatively stable. The purpose of her clinic visit today is to obtain an updated prescription for elastic support stockings.

PHYSICAL EXAMINATION: VITALS: Blood pressure 120/80 in the right arm and 130/80 in the left arm, with pulse 74 and oxygen saturation on room air of 99%. Observation of her lower extremities reveals the familiar appearance of chronic venous insufficiency with extensive pigmentation and scarring from her previous episodes of ulceration. She has no open ulcers at this time, and her edema is well-controlled using her compression stockings.

ASSESSMENT/PLAN: In summary, this patient has chronic venous insufficiency which is being managed adequately. A prescription for two new pairs of Jobst below the knee moderate compression stockings was filled out. She was invited to return to this clinic or call with any questions related to her chronic venous insufficiency.

PROBLEM: LEFT FOOT PAIN

S: See note by Dr. Eggertsen dated 02/25/2002. At that time her x-rays were unremarkable. She comes in today complaining of continued discomfort over the distal portion of the fifth metatarsal on the left. There has been no repeat injury. She does feel, however, that in general her foot pain is improved.

O: Examination of her left foot shows point tenderness over the distal aspect of the left fifth metatarsal. There is no tenderness in other portions of the foot and no tenderness in the midfoot.

X-ray shows osteoarthritis of the talonavicular joint as previously noted. There is no evidence of a fracture of the fifth metatarsal.

A: Foot contusion, healing. She should wear firm footwear and expect continued improvement. I did advise vitamin D and calcium supplementation in general to keep her bones strong. She does have some osteoporosis which we need to follow up for at her next visit. She will return in one month. She is also due for fasting lipid panel, which is ordered.

Patient: HOFFMAN, JEANNE L
MR#: U8170135
Visit: 02/25/2002
Dictator: SAM EGGERTSEN

S: This 77 year old presents with a TWO-WEEK HISTORY OF LEFT FOOT PAIN. She has multiple medical problems, including a history of recurrent phlebitis, for which she is on anticoagulated. Her last INR was 2.6 on Coumadin 10 mg for five days per week and 5 mg on Thursday and Sunday. Her last INR was 2.6. Two weeks ago when pushing a shopping cart full of laundry on a hill, she stumbled and fell onto her right side. Since that time, she has noted pain in the dorsum of her left foot. She wears a right ankle brace chronically. She did not have contusions or bleeding with the fall. She has been ambulating with her cane. She simply decided that today was the day she should be checked for fear that she fractured something.

O: Her weight is 158 lb, blood pressure is 134/80, pulse is 80. Exam of the left foot shows chronic stasis changes and evidence of a skin graft medially. She has intact dorsalis pedis pulses and good capillary refill. There are no areas of skin breakdown. There is no contusion, no ankle swelling. She does have tenderness just distal from the tibia on the dorsum of the foot. She has decreased sharp/dull sensation over the entire foot. She states this is an old finding. She is able to ambulate. Her gait is symmetric and shuffling, assisted with the cane.

A: Foot sprain status post fall two weeks ago.

P:
1. Radiograph.
2. Continue activity and Percocet as needed.
3. Elevation.
4. Followup with Kam Capoccia and with Dr. Neighbor.

PROBLEM: Status post deep venous thrombosis and cerebrovascular accident requiring long-term anticoagulation.

SUBJECTIVE: The patient returns to clinic for followup of repeat rapid protime. She is doing relatively well. No bleeding or bruising. No symptoms of a thromboembolic event. She continues to walk daily with her cane and attributes this to keeping her in good health. She is currently taking warfarin 5 mg on Sunday and 10 mg all other days of the week. She has not missed any doses. Does not take aspirin or ibuprofen. Does occasionally take some acetaminophen.

OBJECTIVE: INR 2.6 (goal 2.0-3.0).

ASSESSMENT: Therapeutic anticoagulation without complications or problems.

PLAN: Advised the patient to continue her current dose of warfarin at 5 mg on Sunday and 10 mg all other days. I gave her some Hemoccult cards to complete and return since her last Hemoccult cards were in November 2000. She remembers how to do these. We reviewed the specific foods and fruits to avoid and she will return these at her next appointment. Otherwise recheck rapid protime in one month.

PT NAME: HOFFMAN, JEANNE
NUMBER: U 8-17-01-35
DOB: 01/06/1925
DOS: 12/12/2001

PROBLEM: LEFT LOWER EXTREMITY THROMBOPHLEBITIS.

SUBJECTIVE: The patient with known history of recurrent deep vein thromboses, just returned on December 5, 2001, from a long train ride across the country. She reports taking her Coumadin at the time. He INR, however, on December 10, 2001, was 1.4. Dosage was adjusted yesterday. She comes in today with a one-day history of a left medial calf swelling, tenderness and redness. Denies fevers, chills, night sweats.

OBJECTIVE: VITAL SIGNS: Per chart. Afebrile. Her left lower leg shows area of redness and induration and tenderness without any skin interruption over the posteromedial left calf. There is no popliteal space tenderness and no tenderness in the thigh.

ASSESSMENT: Left lower extremity calf thrombophlebitis, rule out deep vein thrombosis with asymptomatic extension. Particularly given her subtherapeutic Coumadin level two days ago, also her long train ride.

PLAN:
1. Continue Coumadin at the recently increased dose

2. She is scheduled for duplex for today to rule out deep vein thrombosis which may require heparinization.

3. Otherwise warm moist compresses tid for 30 minutes. Expect improvement in the next 48 hours, otherwise she is definitely to recheck.

4. She requested a refill on her Percocet 5/325 mg for her back pain, #30 given. Flu vaccine was also administered today. She should follow up with me in January if not sooner.

DOB: 01/06/1925
DOS: 12/10/2001

PROBLEM: STATUS DEEP VENOUS THROMBOSIS AND CARDIOVASCULAR ACCIDENT REQUIRING LONG-TERM ANTICOAGULATION.

SUBJECTIVE: The patient returns to the clinic after a lengthy trip to New York. She did have her Coumadin followed at a community health center in New York where she was found to have an INR of 4.4 on
October 15. Her dose was reduced at that time to 5 mg four days a week and 10 mg three days a week and she returns here for followup after that recent dosage change. She has not changed her activity or diet. No other change in her medications. Brings her empty bottle of warfarin with her today. Last dosage she took was last evening. Denies any active bleeding or bruising. No blood seen in her urine or stool. She is interested in returning to see Dr. Neighbor for her hearing.

The INR was 1.4 (goal 2.0 to 3.0).

ASSESSMENT: Subtherapeutic anticoagulation most likely due to recent decrease in dose.

PLAN: Will increase her dose to 5 mg on Sunday and Thursday with
10 mg the remainder of the week. She has 10-mg tablets. She has been therapeutic on this dose in the past. We will recheck her rapid pro time in two weeks to verify her current dose.

Re: JEANNE L. HOFFMAN U8170135 Female Age: 76

Dear Sir:

I have been requested by my patient Jeanne Hoffman and her son Louis Alloin to provide the following medical information pertinent to planned travel of Jeanne Hoffman. I understand from Jeanne that she will be traveling with her son Louis Alloin. Written communication with Mr. Alloin dated 8/17/01 suggests that he is the Family Heritage Tour 2001 Director. I had written a prior letter on July 31 which provided only the information requested of me at the time. I am now providing a complete medical summary and specific recommendations for accommodations during travel.

CURRENT MEDICAL PROBLEM:
Low back pain with nerve impingement.
MRI in August 2001 showed: 1. Mild to moderate degenerative disc and facet joint disease at multiple levels. 2. Mild to moderate central stenosis 3. Moderate right L4-5 and left L5-S1 neural foramina narrowing.

PAST MEDICAL HISTORY:
1. History of seizure disorder. . She is treated with Tegretol, and has not recently had a seizure.

2. History of reflux esophagitis. Currently not a problem.

3. History of bilateral hearing loss since 1982, stable by patient's report.

4. History of recurrent deep venous thrombosis for which she is treated with Coumadin, and Trental, and elastic stockings, and has periodic follow up in Vascular Surgery Clinic.

5. Status post hysterectomy for fibroids in 1971 with bilateral salpingo-oophorectomy.

6. Hypercholesterolemia with last cholesterol being 219 and LDL 139 in September 1999. Recently, cholesterol lowering medications have been added to her dietary regimen..

7. History of positive PPD and negative chest x-ray by history. Documented in 1991 in her Family Medical Clinic record. Asymptomatic.

8. History of right ankle fracture for which
she has been seen in Bone and Joint Clinic. The ankle fracture was in the distant past, but she has been given an ankle brace which has helped her.

9. History of left wrist fracture with Kienbock disease for which she if followed in Hand Clinic, and has had surgical repair.

10. Urinary Tract infection in the Spring of 2001.

11. Poor balance

MEDICATIONS:
1. Atorvastatin 20 mg qd.
2. Coumadin. Dosage as of July 27, 2001 is 5 mg on Sunday and Thursday; 10 mg daily the other days of the week.
3. Tegretol 20o mg tid.
4. Trental 400 mg tid.
5. Elastic stockings.

ALLERGIES AND DRUG REACTIONS
ALLERGY TO PENICILLIN AND SEPTRA.

HEALTH MAINTENANCE:
Her last influenza vaccine was a year ago. She is due for that. Had pneumococcal vaccine in 1991. Sigmoidoscopy to 30 cm in May 2001 secondary to inadequate preparation. Plan is colonscopy in May 2002.

RECOMMENDATIONS FOR TRAVEL:

1. For her back, avoid lifting more than 10 pounds; continue exercises she was given by physical therapy. During travel she will need assistance with her luggage as well as assistance in getting on and off trains and buses.

2. For her balance, it is advisable that she use a cane to help her maintain her balance.

3. Because Mrs. Hoffman can become confused in new environments and has hearing difficulties, it is necessary that she be closely watched by her son or another assistant during the travels.

4. Diet. She should be on an American Heart Association Phase I low fat diet. Because of taking Coumadin, she should consume green leafy vegetables and spinach in moderation--as she already knows. There are no other dietary restrictions.

5. Medications. She administers herself her own medications and should continue to be able to do so during her trip.

Sincerely yours,

William E. Neighbor, MD

DOS: 08/15/2001

PROBLEM: LOW BACK PAIN.

SUBJECTIVE:
See note dated July 31, 2001. The patient reports that her back pain seems improved. She was seen by Physical Therapy but chose to continue the exercises on her own, without continued followup in Physical Therapy. She briefly showed me the exercises that she is doing and they seem appropriate. She occasionally has radiation of the pain from either the right or left lower back to either the right or left upper leg. There is no radiation below the leg. There is no weakness in the legs, and no bowel or bladder dysfunction.

OBJECTIVE:
PHYSICAL EXAMINATION:
VITAL SIGNS: Weight was 162, stable; blood pressure was 150/80, pulse 80 and regular. BACK: Examination of her spine showed it to be straight. I was not able to elicit paraspinal muscle tenderness or tenderness over the spinous processes of the lumbosacral spine today. The SI joints seemed nontender. Straight-leg raising test was negative bilaterally. Examination of her hip showed limited abduction bilaterally, but otherwise a full range of motion. Internal rotation was full. External rotation was limited bilaterally, but nontender. NEUROLOGIC: Reflexes were diminished at the left knee, but she stated this has always been the case. Ankle reflexes were 0 and bilaterally symmetrical. Toes were downgoing. On strength testing, the great toe extensors and ankle dorsiflexors and plantar flexors were bilaterally symmetrical.

RADIOLOGY:
An MRI scan of her lumbosacral spine showed mild to moderate degenerative joint and facet joint disease at multiple levels in the lumbosacral spine. There was mild to moderate central stenosis. There was moderate right L4-5 and left L5-S1 neural foraminal narrowing.
ASSESSMENT:
Low back pain secondary to degenerative joint disease and radiculopathy. There is no evidence of other pathology on her MRI except for spinal stenosis. Whether this is clinically significant is difficult to determine. She is not reporting the typical rest claudication symptoms for spinal stenosis

at the present time. There is no bowel or bladder dysfunction to suggest cauda equina syndrome.

PLAN:
At the present time, I would encourage her to continue her physical therapy exercises. She seems to be improving gradually on her own. It is reassuring we find no other pathology. She will follow up on her back in one month.

PROBLEM: RIGHT WRIST PAIN.
SUBJECTIVE:
See last clinic note. The wrist pain is completely resolved.

OBJECTIVE:
X-rays of her wrist were normal, and were called to her.

ASSESSMENT:
Right wrist pain, status post a fall, now resolved, and x-rays are negative.

PLAN:
Return as needed.

PROBLEM: CHILLS.
SUBJECTIVE:
At the end of her visit, she brought up that in the last few days, she has felt a bit "chilly."

OBJECTIVE:
A urinalysis showed leukocyte esterase positive, and WBCs present. However, culture has been negative as of the date of this dictation.

ASSESSMENT:
"Chills," without evidence of urinary tract infection.

PLAN:
Given that she had brought this up at the end of her visit, I simply told her to schedule another appointment if this continued to be a problem.

ADDENDUM:
Her son wants to take her on a two-month trip on a railway. I did write a letter and faxed it to him and to the company, requesting assistance for her. However, the patient discussed this with me today and states that she really does not want to go on the trip, and thinks that a two-week trip would be long enough. I actually tend to agree with her, given her back situation. I indicated this to her.

DOB: 01/06/1925
DOS: 07/31/2001

PROBLEM: HYPERCHOLESTEROLEMIA, LOW BACK PAIN, RIGHT WRIST PAIN.

CURRENT MEDICATIONS:
1. Atorvastatin 20 mg qd.
2. Coumadin.
3. Tegretol 200 mg tid.
4. Trental 400 mg tid.
5. Elastic stockings.

SUBJECTIVE: Compliant with above medications and diet.
See my last clinic note. The patient has improved somewhat. She has been taking Percodan a few times each week for low back pain. Nonsteroidal anti-inflammatory medications have not been possible for her because of her Coumadin use and the risk of gastrointestinal bleed. She has also been using Tylenol. However, while she has had chronic recurrent back pain over several years, this last episode, which now has lasted two months, is one of the worst that she has experienced. She denies any bowel or bladder dysfunction. One week ago, she fell onto her right wrist. She had a previous fracture of her left wrist, but did not injure the left wrist.

OBJECTIVE: Weight 163 lb, stable, blood pressure 150/80, pulse 76 and regular. Laboratory: Since her last visit, total cholesterol 215. However, triglycerides 148, HDL cholesterol 56 and LDL cholesterol 129. Liver function tests normal. Exam shows tenderness over L4-5 spinous processes. There is also some paraspinal muscle tenderness. Straight-leg test is negative. Reflexes are unchanged from her last visit to me. She has always had decreased reflex in her left knee. Radiology studies: LS spine films at her last visit have shown worse L4-5 degenerative joint disease and bilateral hip degenerative joint disease. The patient has been seen in Physical Therapy on two occasions, but missed a couple of visits. Examination shows tenderness over the radial aspect of the wrist on the volar aspect. No snuffboxtenderness. She clearly has pain on range of motion of her wrist. There is no swelling or ecchymosis.

ASSESSMENT:
1. Hypercholesterolemia in a patient with no known coronary

heart disease, now with satisfactory LDL control.
2. Low back pain, likely secondary to degenerative joint disease, but given this is an unusually more severe episode for her than usual, suggest additional studies, given her pain has lasted for two months.
3. Right wrist injury, status post a fall.

PLAN:
1. Continue diet and atorvastatin. Recheck lipid panel in December 2001.
2. Continue her same medications and advise continued physical therapy. Schedule MRI of her LS spine. She will follow up with me in one month. I will call with results as they become available to us. As she plans travel with her son later this month, I will write a letter to an individual whose name she gave me indicating that she will need assistance with luggage.
3. Right wrist film. If negative, advise ice and followup in one week.

DOB: 01/06/1925
DOS: 06/21/2001

PROBLEM: LOW BACK PAIN FOLLOWUP.

S: Jeanne is a 76-year-old woman who has a history of chronic low back pain and was seen by Dr. Neighbor about two weeks ago with a flare of low back pain and sciatica. At that time, he obtained lumbosacral spine films which were negative for any obvious pathology. He referred her for physical therapy which she has done once and given her some Percodan for pain control. She comes back today, two weeks later, reporting some improvement in her low back pain. She denies any current sciatica symptoms, any numbness or tingling in her lower extremities. She has not required very much of the Percodan for pain relief.

O: Blood pressure is 128/70, pulse is 76. In general a healthy-appearing elderly woman in no distress. Her gait is normal. She is able to flex and extend at the waist without any difficulty. There is no focal bony tenderness along the midline spinous processes. There is no paraspinous muscular tenderness or spasm either. Strength in the lower extremities is 5/5 and symmetric. The ankle jerk reflexes are 2+ bilaterally. The patellar reflex is 2+ on the right and 1+ on the left which the patient claims is her normal pattern.

A: Slowly improving low back pain with sciatica symptoms.

P: Because of improvement, I do not think there is any indication for MRI scanning or bone scanning as Dr. Neighbor had questioned, but I do wish to have her follow up with Dr. Neighbor in four to six weeks to reassess her progress.

DOB: 01/06/1925
DOS: 06/06/2001

PROBLEM: LEFT LOW BACK PAIN AND SCIATICA.

S: A 76-year-old female with a history of recurrent low back pain in the past complains of a one month history of left lower back and buttock pain radiating to the anterior lateral thigh and occasionally below the knee without bowel or bladder dysfunction or weakness in the left lower leg. There has been no recent injury. She did happen to take some Percodan which she had left over from her wrist surgery which significantly helped her back pain without side effects.

MEDICATIONS:
1. Atorvastatin 20 mg qd.
2. Coumadin. Stable dose.
3. Tegretol 20 mg tid.
4. Trental 400 mg tid.
5. Elastic stockings.

O: Weight 161, stable. Blood pressure 151/80. Pulse 80 and regular. She is clearly uncomfortable from her lower back, particularly on motion. Examination shows the spine is straight. There is tenderness over the left lower paraspinal muscles and the left gluteal muscles. Range of motion of the hip shows increased discomfort in abduction and adduction. No pain on internal or external rotation of the hip. Straight leg test positive on the left. Sensation intact in the lower extremity as is her strength in ankle dorsiflexion and plantar flexion. Reflex at her left knee is decreased compared to the right, however, the patient states that this has always been true for years.

A: Left lower back pain and sciatica in a patient with a recurrent back pain over years. She recalls that she used to need traction at home for her back. However, because this is the first significant episode she has had in some time and given her age, we need to rule out other pathology.
P:
1. Lumbosacral spine films and sedimentation rate.
2. Refer to physical therapy for brief back exercise training and appropriate care of her back.
3. Percodan 5 mg 1 po 2 to 3 times daily prn back pain #15 dispensed. She understands she is to

use this
judiciously. Would not advise muscle relaxants because of her history of fall risk. Would not advise nonsteroidal anti-inflammatory medications because of her chronic anticoagulation.
4. Follow up at one month to evaluate improvement. If lack of improvement, would consider bone scan or MRI to rule out other pathology.

PROBLEM: HYPERCHOLESTEROLEMIA.

S: She is compliant with atorvastatin 20 mg qd but is past due for lipid panel and liver function test.

A: Hypercholesterolemia.

P: Lipid panel and liver function test ordered.

PROBLEM: FOLLOWUP HEALTH MAINTENANCE.

S: Mammogram negative. Her sigmoidoscopy was only to 30 cm but was normal. Recommendation was annual Hemoccults and to consider colonoscopy. I advised repeat Hemoccults in May 2002 and will consider colonoscopy at that time.

WILLIAM E. NEIGHBOR, MD

PT NAME: HOFFMAN, JEANNE
NUMBER: U 8-17-01-35
DOB: 01/06/1925
DOS: 05/14/2001

S:
This 76-year-old woman was scheduled for flexible sigmoidoscopy screening by her family physician, Dr. William Neighbor. The patient has a long history of multiple medical problems, including seizure disorder, reflux esophagitis, hearing loss, history of recurrent phlebitis and deep venous thrombosis, currently taking Coumadin 10 mg daily except for Sundays at 5 mg. SHE IS ALLERGIC TO PENICILLIN. She has had a hysterectomy in the past and a bilateral salpingo-oophorectomy. She has been diagnosed with a psychological disorder and hypercholesterolemia. She denies recent problems with the lower GI tract. The patient has a family history positive for polyps in her father but no known cancer in the immediate family. Because the patient was taking Coumadin, an understanding was made with the patient that if we saw some abnormalities, they would not be biopsied at the present time.

Following informed consent, the patient was prepped and draped in the usual manner. She had received one Fleet's enema at the time of the procedure. The external findings were normal. Digital rectal examination was unremarkable. The sigmoidoscope was introduced and was advanced to 30 cm. There appeared to be a very difficult advancement and it was difficult to open up the bowel with adequate amounts of air. At about 30 cm, the exam was causing the patient adequate discomfort to discontinue the exam. It was therefore discontinued and the scope was withdrawn without complication. The air was withdrawn as the scope was withdrawn. There were no polyps, tumors, or masses, but there was one small hyperplastic area at about 10 cm that did not warrant biopsy. A retroflex view just above the rectal sphincter revealed normal findings.

After the procedure, the patient appeared to be quite woozy and unsteady on her feet. She was checked carefully as she seemed to recover, and we stayed with the patient
to make sure she was not going to fall.
A:
Normal sigmoidoscopic examination to about 30 cm with further advancement not possible without excessive patient discomfort.

P:
The patient was informed regarding the findings. She was advised regarding any potential side

effects or complications and will notify us if any difficulties. This particular patient I would consider yearly hemoccult testing and/or the possibility of full colonoscopy. Repeat flexible sigmoidoscopies are unlikely to get much beyond the 30 cm mark. Screening method will depend on the patient's general health and patient preference.

Dr. Mandy Gittler was the resident involved in the case.

OTOLARYNGOLOGY CLINIC NOTE

For the record, Jeanne returns today for followup of a sensorineural hearing deficit. She is wearing an aid in the right ear and is satisfied with its performance. Both ears are clear microscopically to reveal intact drums and normal appearing canals. The option of rehabilitation of the left ear with an instrument is discussed and she will pursue this in our clinic.

PT NAME: HOFFMAN, JEANNE
NUMBER: U 8-17-01-35
DOB: 01/06/1925
DOS: 04/18/2001

MEDICATIONS: As listed on November 1, 2000.

PROBLEM: FOLLOWUP HEALTH MAINTENANCE.

SUBJECTIVE: Patient has not yet received her mammogram, which was ordered today. Hemoccult negative times three, sigmoidoscopy ordered.

PROBLEM: HISTORY OF SEIZURE DISORDER.

SUBJECTIVE: Continues Tegretol. Her CBC, platelets, and liver function tests were normal.

PROBLEM: RECURRENT DEEP VENOUS THROMBOSIS BY HISTORY.

SUBJECTIVE: Patient currently asymptomatic, taking her Coumadin and using elastic stockings appropriately.

OBJECTIVE: INR today 2.18.

Review of her INR shows considerable fluctuation. Her INR will likely bounce back closer to her average of 2.5 without any change of therapy, based upon what we know of her.

ASSESSMENT: Anticoagulation. Suspect her INR will bounce back.

PLAN: Continue current dose of Coumadin, and recheck one month for INR.

PROBLEM: HYPERCHOLESTEROLEMIA.

SUBJECTIVE: Compliant with Zocor.

OBJECTIVE: Total cholesterol was 292, triglycerides 373, HDL 63, LDL 162, on Zocor 20 mg qd.

Liver function tests normal.
ASSESSMENT: Hypercholesterolemia in patient with no known coronary heart disease, but with poor LDL control.

PLAN: Change to atorvastatin 20 mg qd. Repeat LFTs with liver function tests in two months, then see me.

PROBLEM: RECENT URINARY TRACT INFECTION.

SUBJECTIVE: At her last visit on November 1, 2000, urinalysis indicated urinary tract infection, for which she was treated with ciprofloxacin 500 mg bid. She reports that she no longer has problems with her urination. However, when inquiring further, she states that she continues to have nocturia three to four times nightly.

OBJECTIVE: No exam for this problem. Repeat urinalysis shows positive leukocyte esterase. On microscopic exam, 1+ white blood cells, moderate bacteria on minimally contaminated specimen. Her M-7 was normal in November.

ASSESSMENT: Recurrent versus
persistent urinary tract infection.

PLAN: Urine culture, and will re-initiate course of ciprofloxacin.

PROBLEM: RIGHT UPPER ARM INTERDERMAL NEVUS.

SUBJECTIVE: At her last visit in November, I was concerned about the interdermal nevus as it appeared irritated, and had some new blood vessel formation.

OBJECTIVE: Repeat examination today shows a fleshy papilloma on the right upper arm, completely consistent with an interdermal nevus. There is no neovascularization, and no ulceration or other evidence to suggest basal cell carcinoma. Patient reports again today that she has had this for years without any change.

ASSESSMENT: Interdermal nevus.

PLAN: Recheck prn.

ORTHOPEDIC CLINIC NOTE

HISTORY OF PRESENT ILLNESS:
Ms. Hoffman returns for a recheck of her chronic right ankle pain. She states that she has been using the air stirrup when she goes for long walks, and this has significantly improved her pain.

She states that if she is just ambulating around the home, or for short distances, she does not wear the air stirrup. Because she has venous insufficiency, she wears Jobst stockings bilaterally, and does not have complaints of swelling in the right ankle.

She does note that she has had increasing numbers of falls, which have not been due to any instability or pain in the ankle, but she reports that she simply falls without tripping or slipping. She states that she was standing sweeping, and the next thing that she knew, she was on the ground.

She denies any dizziness or shortness of breath prior to these falls.

PHYSICAL EXAMINATION:
EXTREMITIES: Right ankle with no significant swelling. She has tenderness over the anterior talofibular ligament, which is mild and more tenderness over the calcaneofibular ligament. She has some limited ankle and subtalar motion, although it is difficult for her to relax, and I am not sure how much of this is due to her inability to have a good examination. There is no evidence of any instability on varus, valgus or drawer testing.

DIAGNOSTIC FINDINGS:
Radiographs from October 2000 were reviewed, which show that she has some degenerative changes in the ankle, with joint-space narrowing. She also has an anterior-talar spur.

ASSESSMENT AND PLAN:
We again discussed the degenerative changes, and there also appears to be some subchondral cysts in the talus. We discussed that certainly we could excise the osteophyte from the distal talus, or consider further surgical treatment, such as an ankle arthrodesis, or ankle arthroplasty. However, at this point she is relatively asymptomatic, using
simply an ankle stirrup and orthotics, which she has in her sneakers.

At this point, we will follow up with her on an as-needed basis. Certainly, we will see her if she develops any new problems or increased pain.

In addition, I requested that she check in with her family care physician today for further evaluation of the frequent falls.

ORTHOPEDICS CLINIC NOTE

SUBJECTIVE:
Ms. Hoffman is in for followup of Kienbock disease for which she underwent a vascularized bone grafting approximately a year ago. She continues to do reasonably well, though has limited motion of 20 degrees of flexion, 20 degrees of extension and 10 degrees each of radial and ulnar deviation. She still has some pain in the area, though it is better than it was before her treatment. She is doing most activities.

RADIOGRAPHS:
Today show that there has been some additional collapse of the lunate, but it is not a significant change.

ASSESSMENT AND PLAN:
As she is doing functionally fairly well, we will see her back in approximately six months for repeat radiographs at that time.

DOS: 11/01/2000

PROBLEM: A 75-YEAR-OLD FEMALE IN FOR HEALTH MAINTENANCE EXAMINATION.

PAST MEDICAL HISTORY:
1. History of seizure disorder with last abnormal EEG being in 1996. She is treated with Tegretol, and has not recently had a seizure.

2. History of reflux esophagitis. Currently quiescent.

3. History of bilateral hearing loss since 1982, stable by patient's report.

4. History of recurrent deep venous thrombosis for which she is treated with Coumadin, and Trental, and elastic stockings, and has periodic follow up in Vascular Surgery Clinic. She is also on Coumadin which is monitored in our clinic. She has had good control.

5. Status post hysterectomy for fibroids in 1971 with bilateral salpingo-oophorectomy.

6. Hypercholesterolemia with last cholesterol being 219 and LDL 139 in September 1999. Managed with diet alone.

7. History of positive PPD and negative chest x-ray by history. Documented in 1991 in her Family Medical Clinic record. Asymptomatic.

8. History of right ankle fracture for which she has been seen in Bone and Joint Clinic. The ankle fracture was in the distant past, but she has been given an ankle brace which has helped her.

9. History of left wrist fracture with Kienbock disease for which she if followed in Hand Clinic, and has had surgical repair.

FAMILY MEDICAL HISTORY:
Unchanged.

MEDICATIONS:
1. Coumadin 5 mg dose, managed through our Anticoagulation Clinic. 2. Tegretol 200 mg tid.3. Trental 400 mg tid.
4. Zocor 20 mg qhs.
5. Elastic stockings.

ALLERGIES AND DRUG REACTIONS
ALLERGY TO PENICILLIN AND SEPTRA.

HEALTH MAINTENANCE:
Her last influenza vaccine was a year ago. She is due for that. Had pneumococcal vaccine in 1991. Her blood pressure has been normal. Cholesterol is above. She is due for a mammogram and breast examination. Hemoccult is negative one year ago. She did not have a sigmoidoscopy and has not had that
at all, although she is now amenable to it. Does not smoke or drink alcohol to excess.

REVIEW OF SYSTEMS:
She has chronic difficulties with imbalance, but this has not resulted in recent falls, and has not changed. She sees her eye doctor and dentist. She has had no pulmonary or cardiovascular complaints. No abdominal complaints including nausea, vomiting, or change in her bowel movements. Relating to her urinary system, she has noted in the last one to two years increased frequency of urination particularly at night. There has been no history of urinary tract infections. Neurologic review of systems as above, she has had no recent seizures.

OBJECTIVE.
VITAL SIGNS: Weight 160, blood pressure 140/84. Review of her blood pressure show they were in between 120 and 130 systolic, over 70 to 85 diastolic. Pulse 80 and regular. SKIN: She has, on her right shoulder, a skin polyp which has some new vascular changes. She has a few seborrheic keratoses on her back. Remainder of skin examination unremarkable. HEENT: Tympanic membranes clear. Nose clear. Throat clear. NECK: Supple without thyromegaly. She does have hearing aids. CHEST: Clear. COR: S1 and S2 normal, without murmur, gallop, or rub. ABDOMEN: Soft and nontender without organomegaly. EXTREMITIES: Show changes related to venous stasis disease. Reflexes in the knees are bilaterally symmetrical. BREASTS: Unremarkable. Axillae unremarkable. PELVIC: Not done as patient is status post hysterectomy in the distant past for benign disease and does not require Pap smears.
ASSESSMENT and PLAN:
1. Health maintenance. Mammogram ordered. Hemoccult given. Sigmoidoscopy if negative. Next health maintenance exam in one year.

2. Seizure disorder. Controlled with Tegretol. Check CBC, platelets and liver function tests.

3. Bilateral sensorineural hearing loss followed in the ENT. Has hearing aids.

4. Recurrent deep venous thrombosis. She is to continue anticoagulation monitoring through our clinic, and continue Trental and elastic stockings.

5. Hypercholesterolemia. Managed with Zocor. Due for liver function tests and lipid panel.

6. ALLERGY TO SULFA AND PENICILLIN.

7. Status post left wrist fracture with Kienbock disease and repair.

8. Urinary frequency. Check M7 and urinalysis. Follow up in two weeks to discuss this problem further and decide on management.

SURGERY CLINIC NOTE

SUBJECTIVE:
Ms. Hoffman is in for followup approximately two months status post pin removal from a vascularized bone graft to her lunate for Kienbock's on the left side. She feels that she still has some pain on the volar aspect of her wrist with some movements but she is not sure which ones. She is only slowly regaining some movement in her wrist.

OBJECTIVE:
She has been out of immobilization and is doing fairly well. Her motion with the left wrist is limited to approximately 20 degrees of extension and 30 degrees of flexion in the left wrist. Her wound is clean and dry without erythema or exudate. There is no evidence of soft tissue swelling.

ASSESSMENT:
Status post pin removal for vascularized bone graft lunate for left wrist Kienbock's. Doing well.

PLAN:
The patient will return for follow up in six months time for clinical evaluation as well as follow up x-ray examination.

The patient was seen and examined with attending Dr. Nicholas Vedder.

Dictated by Robert Dexter.

CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

ORTHOPEDIC CLINIC NOTE

HISTORY OF PRESENT ILLNESS:
Ms. Hoffman is a very pleasant 75-year-old woman who underwent vascularized bone grafting of the left wrist lunate bone in January 2000, and had her hardware removed over a week ago, but failed her appointment with Dr. Vedder yesterday.

She returns today for suture removal.

PHYSICAL EXAMINATION:
SURGICAL SITE: The wound appears clean, dry and intact. The suture line is well epithelialized. There is a single running Prolene stitch, which is removed under sterile conditions, and the wound edges were made well approximated. Steri-Strips are used to maintain integrity of the wound, and the patient was advised to defer bathing of the wound area for 48 hours.

ASSESSMENT AND PLAN:
I have asked her to return to Dr. Vedder's clinic in six weeks.

CHRISTOPHER H. ALLAN, MD

PT NAME: HOFFMAN, JEANNE
NUMBER: U 8-17-01-35

ADMISSION DIAGNOSIS:
Retained hardware left wrist.

ADMITTING SERVICE/PHYSICIAN:
Orthopedics, Thomas Trumble, MD

OPERATIONS/DIAGNOSTIC PROCEDURES:
Hardware removal on 5/25/00.

HISTORY OF PRESENT ILLNESS:
Ms. Hoffman is a patient who required open reduction and internal fixation of distal radius fracture with a K wire. She unfortunately has a problem requiring anticoagulation for other medical problems. She has symptomatic hardware and requests that her hardware be removed. After a discussion regarding the risks and benefits of hardware removal, she has consented to go forward with this. Due to her anticoagulation status, she was required to be admitted overnight prior to her procedure.

HOSPITAL COURSE:
On the evening of 5/24/2000, the patient was admitted to the Orthopedic Service, where the General Internal Medicine Consult Service also followed her. Her Coumadin was stopped. Her INR was back down to a normal level. The following morning, she went to the operating room and had her hardware removed. There were no complications.

Postoperatively, the patient was admitted to Orthopedic Service and remained on the ward for several days while she was heparinized and then recoumadinized with the help of Medicine Service. She had no complications. Her pain was controlled with oral medicines and when her INR was therapeutic, she was discharged from the hospital.

DISPOSITION:
The patient was discharged to home in the care of her family with teaching on how to do dressing changes for her wrist.

DISCHARGE MEDICATIONS:
None.

DISCHARGE FOLLOWUP:
In one week at the Bone and Joint Center for wound check.

MATTHEW R. CAMUSO, MD

PREOPERATIVE DIAGNOSIS:
Symptomatic implants, left wrist.
Status post vascularized bone grafting for Kienbock's disease.

POSTOPERATIVE DIAGNOSIS:
Same.

PROCEDURE:
Removal of symptomatic implants times two.

SURGEONS:
Thomas Trumble, MD, Attending Physician

OTHER PERSONNEL: Mat Camuso, MD, Resident

ANESTHESIA: General.

PREPARATION: Iodine paint, one gram intravenous antibiotics.

DESCRIPTION OF PROCEDURE:
After the proper level of anesthesia was obtained, the patient was prepped and draped in the usual fashion. A tourniquet was set prior to surgery. The patient's previous longitudinal incision was carefully incised and dissection was carried down to the area of the implants in the capitate. This was guided by fluoroscopy. The extensor tendons were retracted to either side. The implants were located under fluoroscopy and then removed. The wound was irrigated with saline and closed with interrupted 4-0 Vicryl suture and running subcuticular 4-0 Prolene pull out suture. A bulky dressing was applied with a volar plaster splint. The patient was then taken to the recovery area.

05/22/2000

PROBLEM: DVT/CVA/ANTICOAGULATION.
SUBJECTIVE:
The patient returns to clinic for a followup pro-time. She denies any unusual pain, burising or bledding or evidence of thromboembolic event, has not had any change in medication or diet. She states that she is currently taking Coumadin 5 mg on Sunday and 10 mg the rest of the days for a goal INR of 2-3, for deep venous thrombosis and cerebrovascular accident. She states that she is going to discontinue use of Coumadin for the next two days, at which time on Wednesday she will have three pins removed from her hand from a previous surgery. The night of the pin removal, she will restart her Coumadin and return within two weeks for a followup pro-time.

OBJECTIVE:
INR 2.0.

ASSESSMENT:
Therapeutic anticoagulation.

PLAN:
Discontinue Coumadin for the next two days and restart at current dose. Return in two weeks for a followup pro-time.

MEDICINE CONSULT SERVICE - PREOPERATIVE CONSULTATION

REFERRING PHYSICIAN:
Nicholas B. Vedder, MD, Department of Orthopedic Surgery.

IDENTIFYING DATA:
Ms. Jeanne Hoffman is a pleasant, 74-year-old woman who is well known to me from a previous consultation. She had a vascular bone- graft of the left wrist in January, 2000. She is now here for a preoperative evaluation prior to hardware removal in her left wrist. Please refer to my previous dictation for a complete summary of her medical issues.

ACTIVE MEDICAL PROBLEMS:
1.Kienbock disease (as noted previously): The patient underwent surgery on January 21, 2000. She tolerated this procedure well, according to Dr. Vedder's notes. Radiographs demonstrate that her bone-graft is apparently incorporating, and that her Kienbock is stable.

She is now being scheduled for an operative procedure to remove the hardware pins. She is being seen in a preoperative Medicine consultation for this upcoming procedure.

2.Peripheral vascular disease: The patient has had this problem for at least 30 years. She has a history of venous stasis and venous stasis ulcers, as well. She also has a history of multiple deep venous thromboses, as well as pulmonary emboli.

She is on chronic anticoagulation, and she reports that her pro time has been stable. She has been on Coumadin for at least 20 years. She reports no recent problems with regard to lower extremity clot symptoms or ulcers. She continues to wear compression stockings.

3.Hypercholesterolemia.

4.Petit mal seizure disorder: She reports that this problem has been stable. She has mild, brief episodes. Her last episode was approximately two months ago.

5.Glaucoma: This is currently stable. She is taking eye drops.6.Gastroesophageal reflux disease: Currently stable. She takes Prilosec on occasion.

ALLERGIES:
NO KNOWN DRUG ALLERGIES.

CURRENT MEDICATIONS:

1.Coumadin 10 mg po qd, except on Sunday 5 mg.
2.Tegretol 200 mg po tid.
3.Simvastatin 20 mg po qd.
4.Trental
400 mg po tid.
5.Prilosec 20 mg po qd.
6."Glaucoma drops" (the patient did not bring these medications with her, and she does not recall their names. I requested that she bring them in to the hospital when she comes in for her surgery).

EXERCISE TOLERANCE:
The patient currently reports that she is able to walk approximately two miles on level ground without stopping. She can climb four flights of stairs without difficulty.

PHYSICAL EXAMINATION:
GENERAL: The patient is a pleasant, elderly female, who appears younger than her stated age. VITAL SIGNS: Blood pressure 130/70. Pulse 78 and regular. Oxygen saturation 99% on room air. Weight 73.2 kg (161.4 lb). HEENT: Normocephalic, atraumatic. Sclerae are anicteric. Conjunctivae are pink. Oropharynx is benign, without lesion. Jaw mobility is full.

NECK: Full range of motion. Carotid pulses are 2+ bilaterally, without audible bruit. There is no thyromegaly or lymphadenopathy. LUNGS: Clear to auscultation bilaterally, with excellent air excursion. There are no wheezes, rales, rubs, or rhonchi audible. HEART: Regular rate and rhythm, normal S1 and S2. There is no S3 or S4. There is a 1-2/6 systolic murmur at the left sternal border.

ABDOMEN: Soft and nontender. There is a midline hypogastric scar, which is well-healed. Bowel tones are normal. There is no hepatosplenomegaly. EXTREMITIES: There is no clubbing or cyanosis. There are significant hemosiderin deposits on the left shin. She has compression hose. NEUROLOGICAL: Alert and oriented times three. Pupils equal, round, and reactive to light. Cranial nerves III through XII are grossly intact bilaterally. Motor strength is 5/5 in all major muscle groups. Sensory exam is normal to light touch in all extremities. Reflexes are 2+ throughout and symmetric. Coordination is normal on finger-to-nose testing. Gait is within normal limits.

ELECTROCARDIOGRAM:
Dated May 22, 2000 demonstrates a normal sinus rhythm with a right bundle branch block. There are Q waves in the inferior lead, which are old when compared to the prior tracing of January 14, 2000.

PREOPERATIVE ASSESSMENT:
This is a pleasant 74-year-old who is now being scheduled for hardware removal, after a prior vascularized bone-graft of the left wrist.

Her other medical problems include:
1.Peripheral vascular disease with venous stasis.
2.History of hypercoagulability.
3.Hypercholesterolemia.
4.Petit mal seizure disorder.
5.Glaucoma.
6.Gastroesophageal reflux disease.

Ms. Hoffman is at moderately increased risk, primarily due to her known coagulopathy.

RECOMMENDATIONS:
As was done with her previous surgical procedure, the patient will need to be admitted one day prior to her surgical procedure for heparinization, as she comes off of her Coumadin. This heparin drip can be continued until six hours prior to her surgical procedure, and then discontinued.

Postoperatively it can be resumed, at the discretion of her orthopedists when they feel that hemostasis is reasonably assured. Typically, this is 12 to 24 hours postoperatively.

Her Coumadin, as well, can be resumed on the evening after her surgical procedure if hemostasis is stable.
With regard to perioperative recommendations in this patient's care I would recommend the following:

1.The patient was instructed to discontinue her Coumadin between now and the time of her surgery.

2.The patient should be admitted 24 hours prior to her surgical procedure. Upon admission to the hospital, her pro time should be checked. If the INR is less than 2.0, she should be started on a heparin drip and adjusted per our University of Washington Medical Center protocol.

3.The heparin drip should be discontinued six hours prior to her surgical procedure.

4.Postoperatively, the patient's heparin may be resumed, once hemostasis is reasonably assured to the satisfaction of her surgeons. This can be done without bolus if necessary.

5.The patient's Coumadin can be resumed on the evening
after her surgical procedure, if hemostasis is reasonably assured.

6.Postoperative attention should be given to pulmonary toilet.

7.Postoperative attention should be given to deep venous thrombosis prophylaxis, with SCDs until

her heparin is resumed. The patient was instructed to bring her eye drops and hearing aids with her to the hospital.

8.She should be monitored for postoperative delirium. Note that the patient had some mild delirium in the Recovery Room, which resolved quickly.

It was certainly a pleasure seeing Ms. Hoffman again in consultation. If I can be of any further assistance in her perioperative care, please do not hesitate to contact me. I can best be reached through the University of Washington Medical Center's paging operator at (206) 598-6190.

SURGERY CLINIC NOTE

Ms. Hoffman is in for followup of the vascularized bone graft to her lunate for Kienbock's on the left side. She also underwent carpal tunnel release at the same time.

She has been out of immobilization since her last visit and is doing fairly well. She has limited motion with 30 degrees of extension and 20 degrees of flexion. She is working on strengthening.

Radiographs today show that her bone graft appears to be incorporating and she has had no further progression of her Kienbock's. Her capitate shortening appears to have healed as well. We will therefore plan an operative procedure to remove her pins. This will be scheduled in the near future.

SUMMARY

An anonymous RP called 9-1-1 to report a suicide attempt in progress at 225 High School Rd. apt. #2. On arrival, officers contacted a female subject who was staggering on her feet and swaying. She appeared as though she may have been under the influence of drugs. She was mildly combative with officers and medical personnel. She admitted to having taken numerous medications with the intent of committing suicide. She was airlifted to Harborview Medical Center for treatment and evaluation by mental health workers.

Bainbridge Island Police Department

C.R. 2000-00632

Reporting Date	:	03/28/00 at 15:58 hours
Reporting Officer	:	L.W. Berg, 812
Narrative Report	:	Suicide Attempt

0571976

On this date at approx. 15:58 hrs., Cen-Com advised of a possible suicide in progress at 225 High School Rd. #2 (The Rhododendron Apartments). Cen-Com advised that an anonymous caller had advised that someone in apartment #2 was going to kill themselves.

Ofc. Stevens, Res. Ofc. Goller, and I responded. When we arrived on scene, Ofc. Goller went around to the back of the apartment, while Ofc. Stevens and I went to the front door. While Ofc. Stevens knocked on the front door, I looked inside the apartment through the kitchen window, which is next to the door. I observed a female subject sit up from a prone position in the living room area. The female began walking towards the door, but appeared very unstable on her feet. The female appeared to me at first, to be intoxicated. She staggered towards the door, stopping a couple of feet short of the door.

The female, later ID'd as Jeanne Hoffman, stood swaying forward and back for approx. one minute, before answering the door. She had been swaying so much that I thought she might fall over. When Hoffman opened the door, she only opened it about 12 inches, saw that it was the police, and then began to shut the door. I asked Hoffman to wait a moment, which she did. I asked her what was going on, and she said, "Nothing", and started to shut the door again. I put my foot in the door to keep Hoffman from shutting it, and asked her if she was okay. She told me that she was, and told me to take my foot out of the door.

I could clearly see that Hoffman was not okay. It was also clear to me that she was not intoxicated, as I could smell no odor of intoxicants on her breath. Her speech was slightly slurred, she was having great difficulty keeping herself in a standing position, and her eyes lids were fluttering, while her eyes began to roll back in her head. I told Hoffman that we were not leaving, and forced the door open and entered along with Ofc. Stevens. When we entered, Hoffman tried to become aggressive with us, but could not, due to her condition. She raised her hands, but began to fall backwards into the kitchen area. Ofc. Stevens and I caught her, at which time she began to flail about. I grabbed her right arm while Ofc. Stevens grabbed hold of her left arm.

We held Hoffman in this position, both to keep her from falling and / or trying to strike us. I then advised Cen-Com to send in medical personnel. When the aid crew arrived on scene, Guy Roche assisted Stevens and I in bringing Hoffman into the living room where we laid her on the floor. During this time, Hoffman insisted that we just leave her alone.

Hoffman was asked several times if she had taken any medication. She finally told us that she had, saying, "I took anything I could get my hands on". Hoffman would not tell us what she had taken, or why she had done this.

Once in the aid car, Hoffman told the paramedic and me that she had taken most of her medication, but had not taken any alcohol. She told the paramedic that she had wanted to kill herself, but would not tell us why she wanted to die. Hoffman was airlifted to Harborview Medical Center in Seattle, for treatment and mental health evaluation.

At approx. 18:30 hrs., Cen-Com advised that a Douglas Hoffman was requesting a phone call to report his mother, Jeanne Hoffman as missing. I called Hoffman and advised him of the situation involving his mother. He told me that his mother had been under some pressure recently, also saying that "This is how she deals with it". Hoffman told me that this is not the first time his mother has done something like this.

At approx. 20:30 hrs., I called over to Harborview Medical Center. I was advised that

Bainbridge Island Police Department **C.R. 2000-632**

Reporting Date : 03-28-00 at 1558 hours
Reporting Officer : Ofc. E. Stevens, 821
Supplemental Report : Suicide Attempt

On 3-28-00, at approximately 1558 hours, CenCom advised Bainbridge Units of an anonymous caller reporting that the resident of 225 High School Road #2 was committing suicide.

Lieutenant Berg, Officer Goller, and I arrived at approximately 1601 and approached the residence. I knocked on the door and looked in the window to see an elderly female stand up in the living room. I waited for a short time and the subject did not come to the door. Lt. Berg told me that the female was just standing there. I knocked on the door again and the female opened the door a few inches and said "He's not here, go away." She then began closing the door.

I put my foot between the door and the door jam to prevent it from being closed and asked if we could come in. The female, later identified as Jeanne Hoffman, told me that she didn't want us to come in. I could see that Hoffman was having trouble standing up straight and her eyes kept shutting as if they were sleepy.

Lt. Berg and I entered the residence and told her that somebody called and reported that she might be trying to hurt herself. She said something to the effect of "You're damn right". She then leaned back as if she was going to collapse. Lt. Berg and I caught her and held her up. At this point she became combative, telling us to leave her alone.

Lt. Berg asked Hoffman if she had taken anything and she said yes. She said she had taken "everything she could get her hands on". The aid crew arrived and began asking Hoffman what she had taken. She refused to tell them and said that she didn't want to go to the hospital. At one point she said that she "just wanted to die".

See Lieutenant Berg's report for further information.

I certify (declare) under penalty of perjury under the laws of the state of Washington that the foregoing is true and correct. (RCW 9A.72.085.)

ATTENDING PHYSICIAN AND SERVICE:
Ali Samii, MD, ATTENDING, Neurology Service

PROCEDURES:
Gastric lavage was performed in the emergency room and showed the presence of pill fragments.

IDENTIFICATION:
Ms. Hoffman was a 75-year-old woman, who was brought by paramedics following alleged overdose on
prescription medication in a suicide attempt.

HISTORY OF PRESENT ILLNESS:
The patient was a 75-year-old woman, who was brought by medics after she was said to have overdosed on
prescription medications in a suicide attempt. She was brought to the Harborview Medical Center Emergency Room, where gastric lavage was performed with recovery of pill fragments. The patient was
found lying on the floor with eyes closed but responsive. Her vital signs in the field were a blood pressure
of 155/86 and a heart rate of 96. She was reportedly not willing to answer questions. The patient stated
that she took prescription medication overdose in a suicide attempt. She did not specify the amount

or the
type of medication that she had ingested. She tried to kill herself at about 1600 hours on the day of admission. She did not report the reason for this suicide attempt. She denied drinking or smoking. She
also denied illicit drugs. The patient also declined having any release of information to her family.

PAST MEDICAL HISTORY:
1. Peripheral vascular disease.
2. History of multiple deep venous thromboses.
3. Seizure disorder.
4. Primary open angle glaucoma.

ALLERGIES:
TAPE ALLERGY.
THE PATIENT HAS NO KNOWN DRUG ALLERGIES.

CURRENT MEDICATIONS:
1. Pentoxifylline, 400 mg tid.
2. Prilosec, 20 mg po qd.
3. Tegretol, 200 mg po tid.
4. Hydrocodone/acetaminophen, one tablet po q 8 hours.
5. Coumadin, 10 mg po q PM.
6. Simvastatin, 20 mg po qhs.

SOCIAL HISTORY:
The patient lives alone.

HABITS:
The patient denied smoking
or EtOH abuse. She also denied drug use.

PHYSICAL EXAMINATION ON ADMISSION:
VITALS: Blood pressure 139/81, temperature 36, pulse 86, respirations 18.
GENERAL: The patient was an elderly woman, who was crying and locked in restraints. She was in bed and in no acute distress.
HEENT: Unremarkable.
NECK: Supple.
CHEST: The lungs were clear to auscultation.
CARDIOVASCULAR: Heart regular rate and rhythm without murmurs.
ABDOMEN: Soft and with positive bowel sounds.

EXTREMITIES: No edema.
NEUROLOGIC:
MENTAL STATUS: The patient was alert and oriented to person, place, and date.
SPEECH: Her speech was fluent, but she refused to answer questions.
CRANIAL NERVES: Extraocular movements intact. The patient refused pupil examination. Her visual fields were intact to confrontation. Facial motor and sensation were intact over the midline, and the tongue was in the midline.
MOTOR: The sternocleidomastoid and trapezius strength were 5/5. Strength was 5/5 throughout, except for 4/5 left wrist extension/wrist flexion/grip secondary to pain.
COORDINATION: Normal finger-to-nose.
REFLEXES: Her deep tendon reflexes were 2+ in both upper extremities. Knee reflexes were 2+ on the right side and not obtained on the left side. The patient reported that she has a known ankle jerk deficit on the left side. Toes were down-going bilaterally. The ankle jerks were absent bilaterally.

LABORATORY, IMAGING, TESTING DATA ON ADMISSION:
Sodium 139, potassium 3.5, chloride 105, bicarbonate 24, BUN 14, creatinine 0.9, glucose 169, calcium 9.1, white count 4.88, hematocrit 39, PT 23, INR 2, PTT 28, acetaminophen level 5, EtOH level negative, carbamazepine level 14.3, urinalysis normal, liver function tests showed albumin 3.2, total bilirubin 1.1, alkaline phosphatase 84, GOT 26, GPT 8, urine toxicology screen was negative. Repeated carbamazepine serum level the next day was 8.8, calcium 1.18, magnesium 1.7, phosphate 3.6. Repeated coagulase on the next day of hospitalization showed PT 28.3, INR 2.6, PTT 31.

HOSPITAL COURSE:
Mrs. Hoffman was admitted to the neurology service after a suicide attempt with prescription medication overdose. Her urine toxicology screen was negative, as were her acetaminophen and EtOH levels. Electrocardiogram showed normal sinus rhythm and no acute changes. INR of 2. The patient was known to take Coumadin, 10 mg q PM, for her history of multiple deep venous thromboses. The patient also had a seizure disorder for which she was taking Tegretol, 200 mg po tid. Her serum Tegretol level on admission was 14.7. On the next day of admission it was 8.8.

A gastric lavage was performed in the emergency room with recovery of pill fragments. She was placed on suicide precautions, and the psychiatry team was contacted. She remained stable during the entire hospitalization. The patient refused to talk during the entire hospitalization. She demanded that no family members be advised of her health condition. The psychiatry team evaluated the patient and considered her to be suicidal. The patient refused voluntary admission to the psychiatry service.

She was maintained on restraints, given the risk of harm to herself. She was referred to the mental health professionals, who detained her for an involuntary admission to geriatric psychiatry at Northwest Hospital.
During her hospitalization on the neurology service, the patient was maintained on telemetry without any changes in her cardiac rhythm, and she remained hemodynamically stable. Telemetry was discontinued on the next hospital day. The patient was discharged to Northwest Hospital for continuation of treatment, and she was to be detained for 72 hours.

DISCHARGE DIAGNOSIS:
1. Suicide attempt with poly medication overdose.
2. History of peripheral vascular disease.
3. History of multiple deep venous thromboses.
4. History of seizure disorder.
5. History of primary open angle glaucoma.

DISPOSITION:
The patient was placed on a 72-hour hold by the mental health professionals for involuntary hospitalization on the geriatric psychiatry service of Northwest Hospital.

DISCHARGE INSTRUCTIONS:
The patient needs close monitoring of her INR levels, given the Coumadin overdose.

HMC 0479 REV DEC 84 MEDICAL RECORD

008900009777

CONSENT FOR CARE

I, the patient/patient's legal representative, hereby grant permission to University of Washington Medical Centers and University of Washington Physicians/Dentists to perform such examinations and medical and therapeutic procedures as may be professionally deemed necessary or advisable for my/the patient's diagnosis and treatment.

I acknowledge that the University of Washington Medical Centers are teaching hospitals and that teachers, trainees and students may observe or participate in the care provided.

I consent to the examination, use and distribution for educational, scientific and research purposes by the University of Washington medical staff of all biological materials such as body fluids, tissues and organs removed during the course of the above treatment/procedure with privilege of ultimate use and disposal resting with said medical staff. I hereby acknowledge that all such biological materials may be used for the development of one or more research, diagnostic, or therapeutic products. I authorize such potential use and distribution at the discretion of the University of Washington medical staff.

CONSENT FOR RELEASE OF INFORMATION

I hereby authorize University of Washington Medical Centers to release:

1. Any or all of my/the patient's medical information from and to the referring physicians/dentists, health care providers including a public health nurse or home health agency referral, insurance companies and other third party sponsors to facilitate health care, procession of claims, and audit of payments for this period of hospitalization and/or treatment. I understand that the information released may include records in these subject areas: HIV/AIDS, sexually transmitted disease, mental health or mental health treatment and drug and alcohol abuse treatment.
2. Patient information limited to name and general health condition (i.e., my/the patient's health status described in terms of "critical", "poor", "fair", "good", "excellent", or terms denoting similar conditions).
3. My/the patient's religious preference, to the Pastoral Care Program for the purpose of providing pastoral care services.

We keep a record of the health care services we provide you/the patient. You may ask us to see and copy that record. You may also ask us to correct that record. We will not disclose your record to others unless you direct us to do so or unless the law authorizes or compels us to do so. You may get information regarding access to your record from UWMC Patient Data Services in BB304, or by calling 206-598-4344 8:00 a.m. to 4:00 p.m. Monday through Friday, or at HMC Patient Data Services in BS10, or by calling 206-731-3102 8:30 a.m. to 4:00 p.m. Monday through Friday.

These consents may be revoked at any time except to the extent already relied upon, and unless earlier revoked by written notice filed with the Patient Data Services Department and shall expire three years after the date of last treatment.

FINANCIAL AGREEMENT

We agree to:

1. The release of all financial information to the University of Washington Medical Centers and/or University of Washington Physicians/Dentists to include verification by them and/or their agents.
2. Pay to the order of the University of Washington Medical Centers and/or University of Washington Physicians/Dentists all insurance benefits otherwise payable to us, but not to exceed the balance due for services rendered.

We agree to pay to the order of the University of Washington Medical Centers (UWMC - HMC) and/or the University of Washington Physicians/Dentists for services rendered. We understand that the processing of insurance claims is a service and does not relieve us of our financial obligation. We agree that University of Washington Medical Centers and/or the University of Washington Physicians/Dentists may impose reasonable interest, late charges, costs and/or reasonable attorney's fees should our account become delinquent. We agree that any lawsuit for collection of our account may be brought in King County, Washington. We understand that financial responsibility will be waived or reduced if we are determined eligible for charity care.

For Medicare Beneficiary

I request payment of authorized Medicare benefits to me, or on my behalf, for any services furnished to me by or in University of Washington Medical Centers, including Physician Services. I authorize any holder of medical and other information about me to release to Medicare and its agents any information needed to determine these benefits for related services.

We have read and understand the above and hereby affix our signatures.

HARBORVIEW MEDICAL CENTER

PATIENT PROPERTY NOTICE , WAIVER AND ASSUMPTION OF RISK

Harborview Medical Center (HMC) staff respects and promotes the rights of all patients. Patients should expect that efforts are taken to promote a safe and secure environment. HMC will make reasonable efforts to safeguard the personal property of patients, however property is generally the responsibility of patients and their families and HMC cannot guarantee the security of personal property. To minimize potential harm to personal property including loss, misplaced, stolen or damaged items, the following practices will be observed:

- HMC has two choices for storing personal property of patients during hospitalization:

  1. One choice is placing items in the HMC "Valuables and Property Storage System." This choice involves HMC placing valuables (examples, watch, jewelry, dentures and glasses,) or property into a secure area. This "Valuables and Property Storage System" utilizes a witnessed (2 person) property check-in process, is generally for non-essential items and access to this may be limited by hours of operation.

  2. Another choice for storing property is in the patient's room. The patient is generally responsible for these items and these items are generally accessible to the patient. HMC will provide limited locked storage spaces for patient storage of personal property in the hospital room during hospitalization.

- Patients are strongly encouraged to leave and/or send all non-essential belongings and valuables home;

- Biohazards or severely damaged clothing are generally discarded immediately unless required for forensic evidence. (Biohazards means when clothing or other items are contaminated in the judgment of medical staff and presents a health risk.)

- HMC will dispose of unclaimed patient belongings as allowed by law after proper notice and time period for retrieval of items. When patient belongings are not claimed after 30 days, notice will be given and if such property remains unclaimed for an additional 60 days then it shall be disposed of as allowed by law.

- Further information about HMC's property policies and procedures will be provided as needed or requested to the patient/patient's authorized representative.

DATE	***PATIENT'S PERSONAL PROPERTY LIABILITY AGREEMENT***
PT. NO. 03 28 00	I, the undersigned, have read or have been informed about the above policy. I/patient understand that I/patient am responsible for all property brought to Harborview Medical Center. I/patient understand that the hospital recommends all non-essential items be left at home or be sent home with family or friends. I/patient understand that the hospital provides a "valuables and property storage system" for important personal property and that access to this area may be limited by hours of operation. I/patient understand that I/patient am responsible for all personal belongings kept in the hospital room. I/patient agree to hold the hospital and its employees harmless from liability for my/patient's property if it is lost, misplaced, stolen or damaged when such property is not placed in the "valuables system storage" or otherwise under the direct control of the hospital. I/patient further acknowledge the potential harm to property maintained by the hospital due to circumstances beyond the hospital's control (e.g., fire, earthquake) and hereby release the hospital from any liability in such circumstances.

AN IMPORTANT MESSAGE FROM MEDICARE

YOUR RIGHTS WHILE YOU ARE A MEDICARE HOSPITAL PATIENT

- You have the right to receive all the hospital care that is necessary for the proper diagnosis and treatment of your illness or injury. According to Federal law, **your discharge date must be determined solely by your medical needs**, not by "DRGs" or Medicare payments.
- You have the right to be fully informed about decisions affecting your Medicare coverage and payment for your hospital stay and for any post-hospital services.
- You have the right to request a review by a Peer Review Organization of any written Notice of Noncoverage that you receive from the hospital stating that Medicare will no longer pay for your hospital care. Peer Review Organizations (PROs) are groups of doctors who are paid by the Federal Government to review medical necessity, appropriateness and quality of hospital treatment furnished to Medicare patients. The phone number and address of the PRO for your area are:

  The Professional Review Organization for Washington (PRO/W)
  10700 Meridian Avenue North, Suite 300
  Seattle, WA 98133-9075
  (206) 368-8272 Seattle Area
  1-800-445-6941 Toll Free

TALK TO YOUR DOCTOR ABOUT YOUR STAY IN THE HOSPITAL

You and your doctor know more about your condition and your health needs than anyone else. Decisions about your medical treatment should be made between you and your doctor. **If you have any questions about your medical treatment, your need for continued hospital care, your discharge, or your need for possible post-hospital care, don't hesitate to ask your doctor**. The hospital's patient representative or social worker will also help you with your questions and concerns about hospital services.

IF YOU THINK YOU ARE BEING ASKED TO LEAVE THE HOSPITAL TOO SOON

- Ask a hospital representative for a written notice of explanation immediately, if you have not already received one. This notice is called a "Notice of Noncoverage." You must have this Notice of Noncoverage if you wish to exercise your right to request a review by the PRO.
- The Notice of Noncoverage will state either that your doctor or the PRO agrees with the hospital's decision that Medicare will no longer pay for your hospital care.
  + If the hospital and your doctor agree, the PRO does not review your case before a Notice of Noncoverage is issued. But the PRO will respond to your request for a review of your Notice of Noncoverage and seek your opinion. You cannot be made to pay for your hospital care until the PRO makes its decision, if you request the review by noon of the first work day after you receive the Notice of Noncoverage.
  + If the hospital and your doctor disagree, the hospital may request the PRO to review your case. If it does make such a request, the hospital is required to send you a notice to that effect. In this situation the PRO must agree with the hospital or the hospital cannot issue a Notice of Noncoverage. You may request that the PRO reconsider your case after you receive a Notice of Noncoverage but since the PRO has already reviewed your case once, you may have to pay for **at least one day of hospital care** before the PRO completes this reconsideration.

IF YOU **DO NOT** REQUEST A REVIEW, **THE HOSPITAL MAY BILL YOU** FOR ALL COSTS OF YOUR STAY BEGINNING WITH THE THIRD DAY AFTER YOU RECEIVE THE NOTICE OF NONCOVERAGE. THE HOSPITAL, HOWEVER, CANNOT CHARGE YOU FOR CARE UNLESS IT PROVIDES YOU WITH A NOTICE OF NONCOVERAGE.

HOW TO REQUEST A REVIEW OF THE NOTICE OF NONCOVERAGE

- If the Notice of Noncoverage states that your **physician agrees** with the hospital's decision:
  + You must make your request for review to the PRO by **noon of the first work day** after you receive the Notice of Noncoverage by contacting the PRO by phone or in writing.
  + The PRO must ask you for your views about your case before making its decision. The PRO will inform you by phone and in writing of its decision on the review.
  + If the PRO agrees with the Notice of Noncoverage, you may be billed for all costs of your stay beginning at noon of the day **after** you receive the PRO's decision.
  + Thus, you will **not** be responsible for the cost of hospital care before you receive the PRO's decision.
- If the Notice of Noncoverage states that the **PRO agrees** with the hospital's decision:
  + You should make your request for reconsideration to the PRO **immediately** upon receipt of the Notice of Noncoverage by contacting the PRO by phone or in writing.
  + The PRO can take up to three working days from receipt of your request to complete the review. The PRO will inform you in writing of its decision on the review.
  + Since the PRO has already reviewed your case once, prior to the issuance of the Notice of Noncoverage, the hospital is permitted to begin billing you for the cost of your stay beginning with the third calendar day after you receive your Notice of Noncoverage **even if the PRO has not completed its review.**
  + Thus, if the PRO continues to agree with the Notice of Noncoverage, **you may have to pay for at least one day of hospital care.**

NOTE: The process described above is called "immediate review." If you miss the deadline for this immediate review while you are in the hospital, you may still request a review of Medicare's decision to no longer pay for your care at any point during your hospital stay or after you have left the hospital. The Notice of Noncoverage will tell you how to request this review.

POST-HOSPITAL CARE

When your doctor determines that you no longer need all the specialized services provided in a hospital, but you still require medical care, he or she may discharge you to a skilled nursing facility or home care. The discharge planner at the hospital will help arrange for the services you may need after your discharge. Medicare and supplemental insurance policies have limited coverage for skilled nursing facility care and home health care. Therefore, you should find out which services will or will not be covered and how payment will be made. Consult with your doctor, hospital discharge planner, patient representative and your family in making preparations for care after you leave the hospital. **Don't hesitate to ask questions.**

ACKNOWLEDGEMENT OF RECEIPT-My signature only acknowledges my receipt of this Message from the hospital named below and does not waive any of my rights to request a review or make me liable for any payment.

R2 Psych Consult note:

3/29/00 noon

ID - 75yo ♀ s/p overdose of mult meds as suicide attempt, now medically cleared.

PMHx none known

HPI - Pt states she took polydrug overdose in attempt to kill herself, says she "wanted to die"; shrugs shoulders when asked if she's still suicidal. She says "something happened" that led to SA, but wont say what and shrugs shoulders when asked if it would happen again. Pt refuses to answer most other ?'s. Says she sleep but nl app, conc, energy.

FH denies

SH lives alone, 2 kids, one reportedly trying to locate relatives + homosexual which ~~has~~ Family conflicts reported.

Denies psychotic sx: Per Family Med Office at VUMC, Elizabeth Gambola nurse who has known pt x 10 yrs, no h/o ψD/o, although once a few yrs ago did because threatening & police were called. Per SE nurse who spoke c pt's son there are currently multiple family conflicts.

denies tob ETOH drugs

PMH: 52 y/o mult DVTs on coumadin since '95 1° open angle glaucoma

Obj - VSS afeb. INR 2.0 → 2.2 → 2.6 CMP (-) tegretol 14.3 → 12.7 → 8.8 nl range UDS. nl vol. mood "fine" affect hostile. TC Denies AVH/PI vague re SI

TP goal dir I/S poor O×3

meds sertraline 50 QD prn ASA 325 QD tegretol 200 TID coumadin 10 QD restart 5/1500 20 cc/hr 30 hrs lovenox/prn

Imp 75yo ♀ s/p polydrug OD as SA, wishes she had died, vague re: continued SI. Pt describes SA as situational but hostile & wont discuss events, says nothing when asked if situation may come up again.

prn Neighbor @ VUC Fam Med Also Allen Ellsworth Pharm

Axis I - Adjustment D/o c suicide attempt Axis II defer ~~Axis III~~ Axis II s/p polydrug OD, s2 D/o, mult DVT + anticoagulated, glaucoma

Recs (1) Continue restraints for pt safety, pt vague re continued SI

(2) Will refer pt to MHP for possible involuntary psych hospitalization as pt refuses voluntary mgt ψ.

(3) pt will need INR followed c daily blood draws + medical F/u, currently medically cleared.

Thanks for consult, D/W attg Dr Wilson.

ATTENDING PHYSICIAN AND SERVICE:
Ali Samii, MD, ATTENDING, Neurology Service

PROCEDURES:
Gastric lavage was performed in the emergency room and showed the presence of pill fragments.

IDENTIFICATION:
Ms. Hoffman was a 75-year-old woman, who was brought by paramedics following alleged overdose on prescription medication in a suicide attempt.

HISTORY OF PRESENT ILLNESS:
The patient was a 75-year-old woman, who was brought by medics after she was said to have overdosed on prescription medications in a suicide attempt. She was brought to the Harborview Medical Center Emergency Room, where gastric lavage was performed with recovery of pill fragments. The patient was found lying on the floor with eyes closed but responsive. Her vital signs in the field were a blood pressure of 155/86 and a heart rate of 96. She was reportedly not willing to answer questions. The patient stated that she took prescription medication overdose in a suicide attempt. She did not specify the amount or the type of medication that she had ingested. She tried to kill herself at about 1600 hours on the day of admission. She did not report the reason for this suicide attempt. She denied drinking or smoking. She also denied illicit drugs. The patient also declined having any release of information to her family.

PAST MEDICAL HISTORY:
1. Peripheral vascular disease.
2. History of multiple deep venous thromboses.
3. Seizure disorder.
4. Primary open angle glaucoma.

ALLERGIES:
TAPE ALLERGY.
THE PATIENT HAS NO KNOWN DRUG ALLERGIES.

CURRENT MEDICATIONS:
1. Pentoxifylline, 400 mg tid.

Patient Name: HOFFMAN, JEANNE
Patient No: 0-57-19-76
Patient DOB: 01/06/1925
Admit/Serv. Date: 03/28/2000
Disc./Tran. Date: 03/29/2000
Page: 1

Discharge Summary

HARBORVIEW MEDICAL CENTER
325 Ninth Avenue
Seattle, Washington 98104-2499

2. Prilosec, 20 mg po qd.
3. Tegretol, 200 mg po tid.
4. Hydrocodone/acetaminophen, one tablet po q 8 hours.
5. Coumadin, 10 mg po q PM.
6. Simvastatin, 20 mg po qhs.

SOCIAL HISTORY:
The patient lives alone.

HABITS:
The patient denied smoking or EtOH abuse. She also denied drug use.

PHYSICAL EXAMINATION ON ADMISSION:

VITALS: Blood pressure 139/81, temperature 36, pulse 86, respirations 18.
GENERAL: The patient was an elderly woman, who was crying and locked in restraints. She was in bed and in no acute distress.
HEENT: Unremarkable.
NECK: Supple.
CHEST: The lungs were clear to auscultation.
CARDIOVASCULAR: Heart regular rate and rhythm without murmurs.
ABDOMEN: Soft and with positive bowel sounds.
EXTREMITIES: No edema.
NEUROLOGIC:

- MENTAL STATUS: The patient was alert and oriented to person, place, and date.
- SPEECH: Her speech was fluent, but she refused to answer questions.
- CRANIAL NERVES: Extraocular movements intact. The patient refused pupil examination. Her visual fields were intact to confrontation. Facial motor and sensation were intact over the midline, and the tongue was in the midline.
- MOTOR: The sternocleidomastoid and trapezius strength were 5/5. Strength was 5/5 throughout, except for 4/5 left wrist extension/wrist flexion/grip secondary to pain.
- COORDINATION: Normal finger-to-nose.
- REFLEXES: Her deep tendon reflexes were 2+ in both upper extremities. Knee reflexes were 2+ on the right side and not obtained on the left side. The patient reported that she has a known ankle jerk deficit on the left side. Toes were down-going bilaterally. The ankle jerks were absent bilaterally.

LABORATORY, IMAGING, TESTING DATA ON ADMISSION:

Sodium 139, potassium 3.5, chloride 105, bicarbonate 24, BUN 14, creatinine 0.9, glucose 169, calcium 9.1, white count 4.88, hematocrit 39, PT 23, INR 2, PTT 28, acetaminophen level 5, EtOH level negative, carbamazepine level 14.3, urinalysis normal, liver function tests showed albumin 3.2, total bilirubin 1.1, alkaline phosphatase 84, GOT 26, GPT 8, urine toxicology screen was negative. Repeated carbamazepine serum level the next day was 8.8, calcium 1.18, magnesium 1.7, phosphate 3.6. Repeated coagulase on the next day of hospitalization showed PT 28.3, INR 2.6, PTT 31.

HOSPITAL COURSE:
Mrs. Hoffman was admitted to the neurology service after a suicide attempt with prescription medication overdose. Her urine toxicology screen was negative, as were her acetaminophen and EtOH levels. Electrocardiogram showed normal sinus rhythm and no acute changes. INR of 2. The patient was known to take Coumadin, 10 mg q PM, for her history of multiple deep venous thromboses. The patient also had a seizure disorder for which she was taking Tegretol, 200 mg po tid. Her serum Tegretol level on admission was 14.7. On the next day of admission it was 8.8.

A gastric lavage was performed in the emergency room with recovery of pill fragments. She was placed on suicide precautions, and the psychiatry team was contacted. She remained stable during the entire hospitalization. The patient refused to talk during the entire hospitalization. She demanded that no family members be advised of her health condition. The psychiatry team evaluated the patient and considered her to be suicidal. The patient refused voluntary admission to the psychiatry service.

She was maintained on restraints, given the risk of harm to herself. She was referred to the mental health professionals, who detained her for an involuntary admission to geriatric psychiatry at Northwest Hospital. During her hospitalization on the neurology service, the patient was maintained on telemetry without any changes in her cardiac rhythm, and she remained hemodynamically stable. Telemetry was discontinued on the next hospital day. The patient was discharged to Northwest Hospital for continuation of treatment, and she was to be detained for 72 hours.

DISCHARGE DIAGNOSIS:
1. Suicide attempt with poly medication overdose.
2. History of peripheral vascular disease.
3. History of multiple deep venous thromboses.
4. History of seizure disorder.
5. History of primary open angle glaucoma.

DISPOSITION:
The patient was placed on a 72-hour hold by the mental health professionals for involuntary hospitalization on the geriatric psychiatry service of Northwest Hospital.

DISCHARGE INSTRUCTIONS:
The patient needs close monitoring of her INR levels, given the Coumadin overdose.

ANTICOAGULATION

S:Patient returned to monitor protime. She is on Coumadin for multiple clotting events in the past. She is presently on 5 mg on Sunday and 10 mg the rest of the week. She has no bleeding or bruising and no evidence of thromboembolic event. She tells us today that she may have possible hand surgery in May to remove the pins.

O:INR 2.8 which is up from 1.4 on 3/15/00.

A:Therapeutic anticoagulation.

P:She will return in one month for INR monitoring. Advise physician at time of appointment that she is being anticoagulated and to stop anticoagulation approximately five days prior to surgery. After the surgery, she is to start on the current regimen of 5 mg on Sunday and 10 mg the rest of the week. She will return to Roosevelt Family Medicine Clinic to have protime measured.

SURGERY CLINIC NOTE

Ms. Hoffman is in for followup of the vascularized bone graft to her left lunate for Kienbck's disease as well as capitate shortening which was done two months ago.

Radiographs today show that her capitate has healed and the lunate appears to be consolidating. At this point, we will go ahead an leave her out of her cast and convert her over to a splint and have her start some gentleman wrist range of motion out of the splint on a daily basis. We will also schedule her for pin removals from the capitate in the near future.

RECURRENT DVTs/ANTICOAGULATION/INR FOLLOWUP

S:Patient denies any unusual bleeding, bruising, or evidence of thromboembolic event. He has not changed medication or diet or missed a dose. Current dose of Coumadin is 5 mg on Sunday and Wednesday, and 10 mg the other days. She is recovering nicely from her hand surgery and has no complaints at this time.

O:INR 2.4.

A:Therapeutic anticoagulation.

P:Continue current dose. Followup in one month.

ROOSEVELT FAMILY MEDICAL CENTER
CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET

SEATTLE, WASHINGTON 98195

HOSPITAL COURSE:
The patient was admitted one day prior to her surgery for heparinization. She had been on Coumadin for peripheral vascular disease. She had stopped her Coumadin prior to her admission and was placed on heparin. Her heparin was stopped the morning of surgery, and on January 21, 2000, she was taken to the Operating Room for vascularized bone grafting to her left lunate. she tolerated this procedure well and with no difficulties.

Postoperatively, she was restarted on her Coumadin, as well as heparin. Her Coumadin and heparin management were followed by the Medicine Consult Team. At the tine of discharge, her dressing was intact. Her fingers had sensation intact to all, and were able to flex and extend at the MCP, PIP and DIP joints without difficulty. Her INR was greater than 2.

She will follow up with Dr. Vedder in two weeks. She will follow up with her anticoagulation service later this weeks.

MEDICATIONS AT DISCHARGE:
1.Coumadin.
2.Tegretol.
3.Simvastatin.
4.Pentoxifylline.
5.Prilosec.
6. An eye medication.

BONE & JOINT CLINIC FOLLOWUP NOTE

SUBJECTIVE:
This patient is two weeks out from vascularized bone graft to her lunate for Kienbck disease as well as endoscopic carpal tunnel release.

OBJECTIVE:
Her wounds are healing very well at this point and radiographs today show that her fixation and alignment are all intact. Her numbness and tingling appear to be improved following carpal tunnel release.

ASSESSMENT & PLAN:
We will return her to a short-arm thumb spica cast today and have her follow up in approximately one month with radiographs at that time.

PROBLEM: DVT/ANTICOAGULATION.

S:Patient returns to clinic four or five days after resuming Coumadin treatment after being taken off Coumadin four days prior to hand surgery. The patient states that the surgery went extremely well, and she has been basically pain free since, and there was no record of any excessive bleeding. She denies any unusual bleeding or bruising and has not changed her medication, and her diet is pretty well normal right now. She has no evidence of thromboembolic event. She is currently on 5 mg on Sunday and 10 mg the rest of the days of Coumadin for a goal INR of 2-3 for DVT.

O:INR 1.9.

A:Slightly subtherapeutic anticoagulation but expect that it may continue to rise a bit; however, suspect that she will end up somewhere within goal as she has resumed the same dose as before the surgery.

P:Continue Coumadin at current dose. The patient is returning next week for a visit with her primary care provider and will obtain another pro-time at that time to make sure that we are within goal.

RE:HOFFMAN, JEANNE
U 8-17-01-35

Dear Bill:

My colleague, Dr. Philip Vedovatti, had the pleasure of seeing Ms. Jeanne Hoffman in consultation at the request of Dr. Nicholas Vedder, attending physician in the Department of Orthopedics. Hopefully, you received a copy of Dr. Vedovatti's preoperative consultation note under separate cover.

I am happy to report that Ms. Hoffman did return to the University of Washington Medical Center where she underwent a bone graft and extensive surgery on her left wrist on January 21. She tolerated that procedure well. She was transferred to the Surgical Ward in stable condition postoperatively. Because of her anticoagulation needs, she was placed on heparin postoperatively. She was given Coumadin by mouth and, when she was therapeutic on her Coumadin, she was discharged to home in stable condition.

I expect no significant change in her medical therapy other than the addition of Vicodin one to two tablets every four to six hours prn pain and Colace 250 mg po bid while taking the Vicodin.

I left a message for Allan Ellsworth to let him know that the patient was being discharged. I have encouraged Ms. Hoffman to meet with Dr. Ellsworth and have her INR checked later this week to assure that she remains in a therapeutic range. I have asked her to continue her Coumadin at her current dose which is 10 mg daily and 5 mg on Sundays.

It was certainly a pleasure seeing Ms. Hoffman in consultation. If I can be of any further service in her care, please don't hesitate to contact me. The best way to reach me is through the paging operator at 598-6190.

Sincerely,

DOMINIC F. REILLY, MD

PREOPERATIVE DIAGNOSIS:
1.Kienbock disease.
2.Pain and synovitis, left wrist.
3.Carpal tunnel syndrome.

POSTOPERATIVE DIAGNOSIS:
Same.

PROCEDURE PERFORMED:
1.Vascularized bone graft using a bone graft based on the distal carpal arcade with bone graft from the dorsum of the hamate.
2.Synovectomy of radiocarpal joint.
3.Osteotomy of capitate and shortening.
4.Carpal tunnel release with Agee device.

SURGEONS:
Thomas E. Trumble, MD, Attending Physician
Nicholas B. Vedder, MD, Attending Physician

OTHER PERSONNEL:
Marci D. Jones, MD, Resident

ANESTHESIA:
General.

PREPARATION:
Iodine paint and 1 gm intravenous antibiotic.

DETAILS OF THE PROCEDURE:
After the appropriate level of anesthesia was obtained, the patient and general, was prepped and draped in the usual fashion. The arm was elevated and exsanguinated using Esmarch bandage. The tourniquet was inflated to 250 mmHg. Transverse incision was made at the level of the distal wrist crease, centered over the palmaris longus. The incision was made approximately 1 cm in length. The incision was carried down through the skin and subcutaneous tissue, where the small volar veins were then carefully retracted radially in order to protect the palmar cutaneous branch of the median nerve. An L-shaped flap was made in the distal portion of the forearm flexor retinaculum with the base positioned radial and distal in order to protect the palmar cutaneous branches of the medial nerve. Synovial elevators were used to reflect the synovium from the undersurface of the transverse carpal ligament. Hamate sounds were used to dilate the carpal canal. The Agee device

was inserted to a maximum depth of 3 cm. The end of the transverse carpal ligament was clearly visualized. The blade was elevated, and then released while maintaining the transverse fibers of the carpal tunnel ligament clearly within view at all times. Two passes wererequired to completely release the ligament. The patient was noted to have extremely tight carpal canal, and this release dramatically increased the space available for the median nerve. Stevens sternotomy scissors were then used to release the proximal edge of the forearm flexor retinaculum under direct vision with the Stevens sternotomy scissors. The wound was irrigated with saline, and closed with running subcuticular 4-0 Prolene pull-out suture.

The hand was pronated, and the Kienbock disease was addressed. A midline longitudinal incision was made centered over the radiocarpal joint approximately 12 cm in length. The incision was carried down through the skin, and subcutaneous tissue was carefully mobilized. By retracting the extensor tendons distally, it was possible to identify a very large vascular arcade at the level of the carpal bones, which was well aligned for a vascularized bone transfer. The interval between the fifth and sixth compartments was sharply dissected in order to allow the fourth compartment to be elevated off the carpus. Care was taken to preserve the continuity of both the fifth and fourth compartments using the septum between then. Once the fourth compartment was elevated, the bone site for the bone graft and its pedicle could be mobilized. The bipolar cauteries were used to control branching vessels from the pedicle as it traced radially towards its site of joining the dorsal branch of the radial artery. The periosteum around the hamate was incised. Fluoroscopy was used to carefully mark and align the sites of the bone graft. It was taken from within the body of the hamate. Care was taken to avoid injury to the hamate triquetral joint. The Hoke osteotomes were used to elevate this bone graft. There was approximately 4 mm x 4 mm x 6 mm in size. The bone graft was then fully elevated by using sharp dissection to elevate the periosteum from the overlying capitate with the vascularized bone graft in order to avoid injury to the vascular pedicle. Small Freer elevators were placed around the body of the hamate, and a slice of bone was removed from the body of the capitate, taking care to protect the deep structures beneath and volar to the capitate with the elevators. Once the osteotomes had removed the wedge of bone, it was then possible to compress the hamate and secure it with 0.045 Kirschner wires driven from distal to proximal. The Hall bur was then used to prepare a window in the lunate which was exposed, and under fluoroscopy this was cored out to remove the majority of the necrotic bone. The bone graft from the morcellated portion of the capitate that was removed was packed into the lunate, and then the vascularized bone graft was rotated in position and tamped so that it would fit and lock into position. There was noted excellent fit with no soft tissues impinging with wrist extension. The capsular incision was closed loosely with interrupted 4-0 nylon sutures, taking care not to place unnecessary pressure on the pedicle. The fourth dorsal compartment was allowed to return to its position, and it was loosely reapproximated to the fifth compartment using interrupted 4-0 Vicryl sutures. The skin was closed with interrupted 4-0 Vicryl sutures for the subcutaneous tissue, and interrupted 4-0 nylon sutures for skin closure. A bulky dressing was applied with a volar plaster splint. The patient was then awakened and extubated after hard copy x-rays had been

obtained,demonstrating excellent position of the bone graft and the lunate, as well as shortening of the capitate.

Tourniquet time was approximately two hours. The patient was noted to have good capillary refill in the all the digits when the tourniquet was released.

MEDICINE CONSULTATION
PREOPERATIVE EVALUATION NOTE

REFERRING PHYSICIAN:
Nicholas B. Vedder, MD, Attending Physician
Department of Orthopedics (HMC), Box 359798

IDENTIFYING DATA:
Ms. Hoffman is a very pleasant, 74-year-old woman who is referred for medical evaluation. She is being scheduled for a vascular bone graft of the left wrist which is tentatively scheduled for January 21, 2000. Her active medical problems include the following:

1.Left wrist pain. Approximately one year ago, the patient injured her left wrist while getting up from a chair. She has had persistent pain in her wrist and her in left thumb. She has been previously diagnosed with Kienbck disease (lunatomalacia). The patient is now in need of a surgical procedure for treatment of this problem and is being seen in preoperative medicine consultation for this upcoming procedure.
2.Peripheral vascular disease. The patient reports that this has been a problem for her for at least 30 years. She has a history of recurrent venous stasis ulcers and has had extensive treatment for this problem in the past including multiple skin grafts for treatment of venous stasis ulcers. Approximately 30 years ago, the patient had a deep venous thrombosis in her left thigh. She has subsequently had multiple hospitalizations for deep venous thrombosis and she recalls that she has had at least ten hospitalizations for lower extremity thromboses. In the 1970s, the patient reportedly ruled in for pulmonary embolus by pulmonary angiogram at Swedish Hospital. She has been on Coumadin for at least 20 years. Her last leg ulcer was last summer. She currently has no open leg ulcers. She wears compression stockings.
3.Hypercholesterolemia. She is currently taking Zocor.
4.History of seizure disorder. This began after an auto accident in 1970. She had a petite mal seizure lasting a few minutes. She has episodes approximately once every threemonths. She is currently taking Tegretol. She does not drive an automobile.
No history of grand mal seizures.
5.Glaucoma.

PAST MEDICAL HISTORY:
Unremarkable other than noted above. She is gravida 3, para 2.

PAST SURGICAL HISTORY:
1.Total abdominal hysterectomy, bilateral salpingo-oophorectomy in 1969.
2.A right foot and ankle surgery in 1979.

3.Multiple skin grafts, approximately 14 procedures in total, the most recent being approximately 12 years ago according to the patient.
4.Right carpal tunnel surgery five years ago.
5.Bilateral cataract surgeries in 1988 and 1989.

ALLERGIES: NO KNOWN DRUG ALLERGIES.

CURRENT MEDICATIONS:
1.Coumadin 10 mg po q day.
2.Tegretol 200 mg po tid.
3.Simvastatin 20 mg po q day.
4.Pentoxifylline 400 mg po tid.
5.Prilosec 20 mg po q day prn.
6.Glaucoma drops of which she does not recall the name.

REVIEW OF SYSTEMS:
Negative for symptoms of angina, congestive heart failure or coronary artery disease. Negative for myocardial infarction, arrhythmias, hypertension, or valvular heart disease. Negative for diabetes, thyroid disease, liver disease, peptic ulcer disease, anemia, stroke, psychiatric illness, pulmonary disease, or renal insufficiency.

Review of Systems is positive for peripheral vascular disease, occasional gastroesophageal reflux symptoms, seizures, arthritis, history of deep venous thrombosis, as well as hearing impairment and the patient wears a hearing aid.

FAMILY HISTORY:
Notable for hypercoagulable state in her maternal grandmother. She also had a history of venous ulcers.
HABITS:
The patient is a life-long nonsmoker. She drinks alcohol rarely. She denies any recreational drugs.

SOCIAL HISTORY:
The patient lives on Bainbridge Island. She has been widowed for the past 27 years. She has two grown children and two grandchildren. She previously delivered newspapers for a living.
EXERCISE TOLERANCE:
The patient states that she is able to walk at least two miles on level ground. She can climb four flights of stairs without difficulty.

PREVIOUS SURGICAL COMPLICATIONS:
The

patient denies any intraoperative or postoperative surgical or anesthetic complications.

PRIMARY CARE PROVIDERS:
William Neighbor, MD, Primary Care Physician
Family Medicine, Box 354770

D. Eugene Strandness, Jr., MD, Vascular Surgeon
Department of Surgery, Box 356410

PHYSICAL EXAMINATION:
GENERAL: The patient is a pleasant, elderly female who appears younger than her stated age. VITAL SIGNS: Blood pressure 138/74, pulse 78 and regular. Weight is 156 lb (70.7 kg). Oxygen saturation is 99% on room air. HEENT: Normocephalic, atraumatic. Sclerae are anicteric. Conjunctivae are pink. Dentition is good. Jaw mobility is full. NECK: Full range of motion. Carotid pulses are 2+ bilaterally without audible bruit. There is no thyromegaly or lymphadenopathy. CHEST: Clear to auscultation bilaterally with good air excursion. There are no wheezes, rubs, rales, or rhonchi audible. CARDIOVASCULAR: Regular rate and rhythm, normal S1 and S2. There is no S3 or S4. There is a 1-2/6 systolic murmur at the left sternal border. ABDOMEN: Soft, nontender, nondistended with normal abdominal bowel sounds. There is a midline hypogastric surgical scar which is well healed. EXTREMITIES: There is no clubbing, cyanosis, or edema. Peripheral pulses are 2+ distally in the upper extremities. There are significant hemosiderin deposits in the left chin. The patient is wearing compression hosebilaterally. NEUROLOGIC: The patient is alert and oriented times three. Pupils are equal, round, and reactive to light. Motor strength is 5/5 in all major muscle groups. Sensory exam is normal to light touch in all extremities. Reflexes are 2+ throughout and symmetric. Coordination is normal to finger-to-nose testing. Gait is within normal limits.

Electrocardiogram demonstrates a normal sinus rhythm with a ventricular rate of 72 beats per minute. There is a right bundle branch block.

IMPRESSION/RECOMMENDATIONS:
Preoperative assessment in this pleasant 74-year-old woman
who is in need of an orthopedic hand surgical procedure for treatment of Kienbck disease. Her other medical problems include a history of venous stasis ulcers, recurrent deep venous thrombosis with a history of pulmonary embolus, hypercholesterolemia, a history of petit mal seizures and glaucoma.

Ms. Hoffman is at a moderately increased risk for perioperative complications. This is primarily due to her age greater than 70, her history of recurrent thromboses and pulmonary embolus as well as her other medical problems.

To the patient's benefit, she has tolerated multiple surgical procedures in the past. A greater majority

of her medical problems appear to be well compensated at this point in time and she has excellent exercise tolerance. As such, I see no specific contraindication to proceeding with her planned surgical procedure. Given the patient's chronic anticoagulation as well as her risk of perioperative thromboses, I would recommend that the patient be admitted 24 hours prior to her surgical procedure for heparinization.

With regards to specific recommendations in this patient's care, I would suggest the following:

1.The patient should be admitted 24 hours prior to her surgery for heparinization with a heparin drip. The patient was instructed to discontinue her Coumadin four days prior to surgery and this was given to her in a written note.
2.The patient's heparin is to be stopped six hours prior to her surgical procedure. This can be resumed postoperatively whenher surgeons are reasonably confident with hemostasis. Typically this is eight to 12 hours after surgery.
3.The patient's Coumadin can be resumed on the evening after her surgical procedure if hemostasis is well achieved.
4.Postoperative attention to pulmonary toilet with incentive spirometry, 10 puffs every hours while awake in the immediate postoperative period.
5.Aggressive postoperative attention to deep venous thrombosis prophylaxis. The patient should have sequential compression
devices until her heparin is resumed. Early ambulation is also recommended.
6.The patient was instructed to bring her eyedrops and her hearing aid with her to the hospital.

It was certainly a pleasure seeing Ms. Hoffman in consultation. If I can be of any further assistance in her perioperative care, please do not hesitate to contact me. I can best be reached through the University of Washington Medical Center Paging Operator at 206-598-6190.

PROBLEM: Coagulopathy.

SUBJECTIVE:
Routine Coagulation Clinic visit following up on dosage reduction. She takes 10 mg of Coumadin daily, 5 mg on Sunday, with no problems. No bruising or bleeding. She is going to get a flu shot today as she hasn't had one and her son has just had illness.

OBJECTIVE:
Prothrombin time (INR): 2.6

ASSESSMENT:
Anticoagulation for coagulopathy, on target at 2-3.

PLAN:
Continue above dose. Return in one month. Flu shot today.

CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

BONE & JOINT CENTER NOTE

Ms. Hoffman is a 74-year-old female who has been diagnosed previously with Kienbock disease. She is in today for follow up on the EMG study. She reports that the pain in the left wrist is unchanged.

On examination today she does have mild pain over the lunate bone on the dorsal surface of the wrist. She also has pain over the CMC joint and a mildly positive grind test. It is felt that this pain is most likely radiating from the lunate. Range of motion on the left is decreased compared with the right but sensation in intact to light touch and symmetric.

EMG study showed a latency at the motor conduction median nerve on the left at 3.7 m/sec and on the sensory conduction of 4.0 m/sec.
IMPRESSIONS:
1.Kienbock disease, left.
2.Minimal carpal tunnel syndrome on the left side.

PLAN:
We did discuss the risks and benefits with the patient and we would recommend a vascularized bone graft from the third metacarpal to the lunate bone as well as a capitate shortening. Also, I am recommending an endoscopic carpal tunnel release. The patient does have a history of peripheral vascular disease related to chronic ulcers in her legs as well as a seizure disorder. We will have her see Medicine Consult Service because she is on Coumadin. Preop and consent were done today, and we will see her back for surgery. If she has any problems prior to that time she should follow up sooner.

The patient was evaluated and examined with Nicholas Vedder, MD.

RE:HOFFMAN, JEANNE
U 8-17-01-35

Dear Dr. Hoffman:

Thank you very much for referring Ms. Hoffman to us for electrodiagnostic testing. As you know, she is a 71-year-old female with a history of Kienbock's disease. We performed an extensive electrodiagnostic test and, in sum, we have a minimally abnormal study. The patient's median motor nerve conduction studies were normal. Her CMAPs were within normal limits and her conduction velocity was also fine. However, when we looked at the median sensory studies, she did have slight prolongation of her distal latencies when comparing this study to both radial and ulnar sensory across the wrist.

These findings are consistent with a mild case of median neuropathy of the wrist on the left (carpal tunnel syndrome). There appears to be no active motor involvement at this time.

Thank you very much for allowing us to participate in this patient's care. Please do not hesitate to give me a call if there are any further questions.

ORTHOPEDIC CLINIC NOTE

The patient is a 71-year-old right-handed housewife who presents with left wrist pain which has gradually worsened over the past year. She has sharp pain in her wrist area which occasionally radiates to her elbow and digits. She has occasional numbness in her wrist and digits. She is very weak in that hand with an inability to grasp items. She drops items due to the weakness and the pain. The patient states that the left hand did slip off the edge of a chair approximately a year ago but that is the only injury or trauma that she knows of on that hand. Over the past couple of months the patient states that she has had bouts of sharp pain for several seconds without any activity. The patient has not taken any medications or used any other methods to relieve the pain. The patient states she is tolerating the pain in order to perform daily activities.

MEDICATIONS:
Tegretol, Coumadin, lovastatin, and Trental.

ALLERGIES:
SULFA CAUSES RASH. PENICILLIN CAUSES RASH.

PAST MEDICAL HISTORY:
Petit mal seizures, blood clots, right carpal tunnel release in the 80's.

PHYSICAL EXAMINATION:
GENERAL: This is a 70-year-old right-handed female who presents with left wrist pain. SKIN: The skin color is blanched compared to the right side. MUSCULOSKELETAL: There is swelling around the MCP and CMC joints. There is dorsal and palmar swelling and stiffness in the wrists. On range of motion her ulnar deviation is 10 on the left, on the right 12. Radial deviation on the left is 12, right 10; flexing 48 on left, 75 on right; extension 30 on left, 4 on the right. Grip strength is 6 on left, 24 on right. There is no flexion in the left second PIP joint due to arthritis.

Radiographs show increased density of whiteness around the lunate bone which has progressively worsened from January 1999 to September 1999.

ASSESSMENT:
Kienbock's disease.

PLAN:
EMG on left wrist to rule out carpal tunnel. Depending on the results of the EMG surgery was discussed for a capitate shortening and vascularization bone graft. The patient is to wear a wrist splint until that time. The patient has been instructed to return to the clinic after the EMG result. The

patient was advised to contact the clinic if her symptoms worsen before her next appointment.

The patient was seen and examined by Dr. Vedder.

Dictated by Cathy Fabrega, PA student

Dear Ms. Hoffman:

I enjoyed seeing you on 09/21/99. The x-ray of your left wrist did reveal some significant abnormalities in the bones of your wrist. It is important that you obtain an appointment in Orthopedics as we had planned at the time of the visit. Please call our office if you have not yet been able to schedule an appointment in Orthopedics.

I would also remind you to have your blood drawn for the several blood tests that we ordered at the time of your visit, and I would also remind you to schedule your mammogram and to return your stool tests for hidden blood.

Sincerely,

WILLIAM E. NEIGHBOR, MD

FAMILY MEDICINE CLINIC NOTE

PROBLEM: LEFT WRIST PAIN AND WEAKNESS

S:The patient is status post minor left wrist injury in January 1999, at which time x-rays revealed sclerosis of the lunate and a subchondral cyst, but no acute fracture. She was treated conservatively and symptoms completely subsided over a couple of weeks. However, she now states that two months ago, she began to develop some gradual onset of weakness and pain over the dorsum of her left wrist, with no clear history of repeat injury. However, as noted before in her chart, patient is a poor historian. However, she does not recall a fall. She has also begun to develop numbness, particularly at night, over all of her fingers.

O:Weight 146, blood pressure 130/70, pulse 76 and regular. Examination of the LEFT WRIST does reveal diffuse swelling over the medial and lateral aspects, as well as the dorsum of the wrist. There is no ecchymosis. She has diffuse tenderness over the dorsum of the wrist, as well. I am not able to identify one point that is more tender than another. There is discomfort on dorsiflexion, as well as on radial and ulnar deviation. There is no tenderness in the anatomic snuffbox. Sensation is decreased to light touch over the dorsum of the wrist and fingers, but not so much over the volar aspect of the hand or fingers. Strength is decreased and there is some wasting of the hypothenar and thenar eminence. Grip strength is clearly decreased.

X-ray pending.

A:Left wrist pain with muscle wasting and sensory changes suggestive of neuropathy. Need to exclude occult fracture.

P:X-ray pending. Referral to Orthopedics for further evaluation and management. Elected not to obtain nerve conduction studies at the present time to pinpoint site of nerve entrapment. No acute therapy offered as symptoms have been present for about two months.

PROBLEM: HYPERCHOLESTEROLEMIAS:Reports compliance with simvastatin 20 mg qd. Past due for cholesterol testing.

A:Hypercholesterolemia.

P:Fasting
lipid panel and AST ordered.

PROBLEM: TRENTAL AND TEGRETOL THERAPY

S:On Trental for recurrent veno-occlusive disease and Tegretol for seizure disorder. Due for CBC, platelets, and liver function tests, which are ordered.

PROBLEM: HEALTH CARE MAINTENANCE

S:Immunizations are current. Blood pressure has been normal. Cholesterol as above. She is due for mammogram with the last being in early summer of 1998. She is status post total abdominal hysterectomy and bilateral salpingo-oophorectomy for benign disease in the past and does not require regular Pap smears. She takes calcium supplementation in her diet. Past due for Hemoccult testing. Has refused sigmoidoscopy in the past. Does not smoke or drink alcohol to excess.

A:Health care maintenance.

P:Fasting blood sugar, TSH, mammogram and Hemocculs ordered. Sigmoidoscopy advised if Hemocculs are negative. Advised annual flu vaccine.

DEPARTMENT OF SURGERY CLINIC NOTE

SUBJECTIVE:
Jean Hoffman is an elderly patient who has been followed by
Dr. Strandness for over 20 years for venous ulcerations of both legs. She presents today with two Unna boots on, having been placed in the hospital. Prior to her recent discharge we took the Unna boots off and both of her ulcers had basically healed. We saw her then with
Dr. Strandness, replaced her Unna boots, and will take her Unna boots off next week and the refer her back to Dr. Strandness for continued care.

CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

ADMISSION DIAGNOSIS:
Nonhealing erythematous venous stasis ulcers.

DISCHARGE DIAGNOSIS:
Same.

HISTORY OF PRESENT ILLNESS:
Ms. Jeanne Hoffman is a 74-year-old female with a longstanding history of deep venous thrombosis and hypercoagulable state with venous stasis ulcers, presently on Coumadin 10 mg po q day, status post multiple split-thickness skin grafts for nonhealing ulcers. The patient states she went on an extended vacation starting in June and noticed an ulcer on each ankle during this time which have gotten larger, despite elevation and ointment. The patient states that the area has become more erythematous, although is nontender. The patient was seen in Vascular Clinic by Dr. Strandness and was admitted for nonhealing ulcers bilateral lower extremities.

PAST MEDICAL HISTORY:
1.Seizure disorder.
2.Dysphagia and heartburn secondary to gastroesophageal reflux disease.
3.History of deep venous thrombosis and hypercoagulable state.
4.Glaucoma.
5.Hypercholesterolemia.
6.Chronic hearing loss.
7.History of positive PPD.
8.History of right hip degenerative joint disease and osteoarthritis.
9.History of vertigo and falls.

PAST SURGICAL HISTORY:
1.Multiple split-thickness skin grafts to lower extremities for venous stasis ulcers.
2.Hysterectomy 1969.

MEDICATIONS ON ADMISSION:
1.Simvastatin 10 mg po qhs.
2.Coumadin 10 mg po qhs.
3.Omeprazole 20 mg po q day.
4.Chlorhexidine 0.12% mouth rinse bid.
5.Metipranolol 0.3% solution, one drop to bilateral eyes bid.
6.Tegretol 200 mg po tid.
7.Trental 400 mg po tid.
8.Advil prn.

ALLERGIES:
THE PATIENT IS ALLERGIC TO PENICILLIN AND SULFA.

PHYSICAL EXAMINATION ON ADMISSION:
VITAL SIGNS: Temperature 36.7. Blood pressure 118/70. Heart rate 67. Respiratory rate 16.
EXTREMITIES: Bilateral lower extremities show superficial venous stasis ulcers over previous split-thickness skin graft sites. Surrounding area is erythematous and blanching. Ulcers are nontender. The patient has no proximal skin tracking or tenderness.

HOSPITAL COURSE:
The patient was admitted to the Vascular Surgery Service under the care of Dr. Strandness. The patient was started on IV Kefzol for superficial skin cellulitis and her ulcers were started on tid wet-to-dry dressing changes. Over the ensuing days, the patient's ulcers became more dry and the surrounding erythema dissipated. Ankle-arm indices were performed by Vascular Diagnostic Services which showed an ankle-arm index of greater than 1 bilaterally and great toe pressures of 120. No significant arterial insufficiency or small vessel disease was noted. The patient was seen by Plastic Surgery Service for evaluation of her skin ulcers which were found to be superficial and not in need of operative treatment at this time. The patient reports significant improvement of her ulcers over her hospital stay and Unna boots were placed on bilateral lower extremities on discharge. The patient is to continue on oral Keflex for a total of six days and will followup in the Vascular Surgery Clinic and Plastic Surgery Clinic in one week for continuing followup.

DISCHARGE MEDICATIONS:
1.Keflex 500 mg po qid times six days.
2.Simvastatin 20 mg po qhs.
3.Coumadin 10 mg po qhs.
4.Omeprazole 20 mg po q day.
5.Metipranolol 0.3% one drop to bilateral eyes bid.
6.Tegretol 200 mg po tid.
7.Trental 400 mg po tid.
8.Chlorhexidine 0.12% solution mouth rinse, 15 cc, bid.

PATIENT CARE INSTRUCTIONS:
1.The patient is to keep Unna boots clean and dry.
2.The patient is to continue to take her antibiotics as directed.
3.The patient is to followup in the Plastic Surgery Clinic and Dr. Strandness in Vascular Clinic in one week.

4.The patient should keep bilateral lower extremities elevated when at rest.

FOLLOWUP INSTRUCTIONS:
The patient is to followup with Plastic Surgery Clinic in one week and with Dr. Strandness in Vascular Clinic in one week.

BRUISE, INNER ASPECT LEFT THIGH
S:Patient had a significant fall about a week ago. She hit her head and her knee. She was evaluated in Family Medicine Clinic on the first of June and was diagnosed with contusions on her upper face and both knees. She is worried because a bruise has appeared on the inner aspect of her left thigh. She is on chronic Coumadin therapy for recurrent deep venous thromboses. She has not had any other injuries. She has been able to weight-bear without difficulty since the original incident.

O:The patient is somewhat disorganized but is otherwise in no apparent distress. Blood pressure 156/90, pulse 88 and regular. Examination of her legs reveals an old bruise on the inner aspect of her left thigh measuring approximately 5 to 6 cm in longest diameter. Range of motion of both hips and knees is good. There is some tenderness to palpation over the knees.

A:Contusion secondary to recent fall.

P:Patient will return to clinic for routine followup for her Coumadin therapy in the next week. Her last prothrombin time international normalization ratio was done on May 19th and was 2.5. Should her condition deteriorate between now and then, she will return to clinic.

06/01/99
FALL
S:The patient 72 hours ago was walking rather fast behind a couple of her grandchildren when she felt she missed her step and fell forward striking both knees and eventually falling on her face striking the bridge of the nose with subsequent compression of her eye glasses over her upper facial area. She was able to get up without any assistance, and denied having felt dizzy or lightheaded either before or after the fall. She went home and applied some ice to the area and took some Advil for some inflammation and soreness. The patient is on Coumadin. Her last Coumadin level was on May 19, 1999, and it was at 2.5, well within the therapeutic range. She has a primary care provider at this setting and is scheduled to come back in 10 days to see him. She is also under the care of Dr. Ellsworth and is supposed to be coming back to have her Coumadin level sometime in the next two to three weeks. She feels otherwise well other than having some bruising around the periorbital areas and the dorsal aspects of the bilateral knees. She denies any loss of consciousness, seizure-like activity, any focal neurologic deficits, etc. She otherwise feels no change in her health.

CURRENT MEDICATIONS:
Coumadin

ALLERGIES:
PENICILLIN CAUSES RASH.

REVIEW OF SYSTEMS:
Otherwise unremarkable at this time.

O:GENERAL: No acute distress. HEENT: Tympanic membranes easily visualized and without any bleeding or redness. Inspection of the skin along the periorbital areas bilaterally revealed a moderate amount of erythema and ecchymosis. Some of the areas are beginning to turn somewhat ecchymotic, but these are not very tender with palpation. There is no stepoff noted periorbitally with palpation. She does have some tenderness along the bridge of the nose which appears to be slightly still somewhat inflamed. Inspection of the nasal mucosa is within normal limits. Pupils equal, round, reactive to lightand accommodation. She had a normal fundoscopic exam. Mouth clear. NECK: Supple.
No adenopathy or tenderness was noted with range of motion. LUNGS: Clear to auscultation bilaterally. HEART: Regular rate and rhythm. EXTREMITIES: Lower extremities, the skin overlying the anterior aspect of both knees was noted to have a slight amount of soft tissue swelling but nontender. She did have some bruising as well. The rest of the physical examination essentially normal.

A:Contusion on the upper face and bilateral knees status post fall.

P:1.The patient requested a refill on her medication consisting of Lortab-5. She was given #15 and advised to take this very seldom and only when needed for pain.
2.The patient is scheduled to come back in the next two to three weeks to have another Coumadin level, and she is also scheduled to see Dr. Neighbor in the next 10 days. She is advised to come back sooner should she have deterioration of her neurologic status or start feeling worse.

03/30/99
ANTICOAGULATION
S:The patient returns to clinic for routine INR draw. Reports nausea and vomiting x 1 week. She claims that she has been throwing up at least one to two times per day for the past several days. The onset was fairly quick and does not correspond with the type of food she eats. Denies fever, chills, diarrhea, headaches, swelling in her lower extremities. Patient has history of dysphagia with esophageal stricture which was dilated in March 1998.

O:INR 1.18.

A:Subtherapeutic anticoagulation, likely secondary to vomiting of the medication. From history, it sounds as if patient is vomiting within several hours of taking the pills. Will not adjust dose at this time but will, instead, refer for appointment and get her back on her normal Coumadin dose.

P:1.Scheduled appointment for today.
2.Continue with current Coumadin dose. Recheck by end of week.

03/30/99
LOW INR

S:The patient had an INR drawn today which was reportedly low. She says it was 1.18. She was seen by Ginger Woodford, who was concerned about a history of vomiting that she has had. The patient states that this vomiting only has occurred about three times in the past three weeks and always seems to occur at about 12 midnight to 1 AM when she is sleeping. The first time she brought up a little bit of red water, the next time she brought up some clear sour water, and last night she had a little bit of orange sour water. The fluid seems to come up effortlessly. There is no associated heartburn. She has had some difficulty with pain while swallowing in the last few days. She had been prescribed Prilosec for significant reflux but had run out of that medication about a week ago. She has had her prescription refilled today.

O:GENERAL: Patient alert, cooperative, oriented x 3. In no acute distress. She does not appear to be in any way acutely distressed. ABDOMEN: Examination reveals bowel sounds quite active. Abdomen soft. Slight tenderness in the left upper quadrant. No detectible organomegaly or masses.

A:INR low for unclear reasons. It is possible that the patient may have forgotten a dose. I was also wondering about the possibility of her Prilosec and the lack of it interfering with her INR, but in discussing with Dr. Al Ellsworth, it is unlikely that the Prilosec would make a great deal of difference in her INR.

P:The patient was encouraged to restart her Prilosec. She will stay on her same dose of Coumadin and will return to clinic in one weeks time for another INR check. The patient was happy with this plan. Otherwise return to clinic prn.

FOLLOW UP LEFT WRIST EXTENSOR TENDONITIS
S:The patient states that symptoms significantly improved, however, she continues to complain of some discomfort over the base of the thumb.

O:Examination, instead of revealing tenderness over the dorsal tendons of the wrist, as on January 11, 1999, now shows tenderness over the extensor brevis tendon of the thumb. There is a question of tenderness in the anatomic snuffbox, though on repeated examination this is difficult to elicit. X-ray today was completely unremarkable except for a cyst in the lunate bone. There was no evidence of fracture.

A:Wrist extensor tendonitis, improving, without evidence of underlying fracture.

P:Continue to use wrist splint and ice prn. Avoid overuse of nonsteroidal anti-inflammatory medications. Expect complete resolution over the next month, otherwise recheck.

DEGENERATIVE JOINT DISEASE RIGHT HIP
S:See note dictated January 11, 1999. The patient was seen in physical therapy and has been doing the exercises and felt improved.

O:No examination.

A:Right hip degenerative joint disease in a patient with a history of low back pain which is chronic and recurrent, as well as right ankle osteoarthritis. She has shown improvement with physical therapy.

P:Continue physical therapy and expect return to normal ambulation.

PHYSICAL THERAPY CLINIC

INITIAL EVALUATION

REFERRING PHYSICIAN: William E. Neighbor, M.D. ID# 6267.

DIAGNOSIS: Right hip pain and Degenerative Joint Disease.

PATIENT IDENTIFICATION:
This is a 74-year-old female who has a chief complaint of right hip and low-back pain. She also complains of bilateral ankle pain; right greater than left.

HISTORY:
She states that her right hip pain increased about six months with insidious onset. She has had the low-back pain for years.

She states that she continues to walk four to six miles every day, usually about two miles at a time. She feels that she does have some increased pain after walking, but does not want to give up walking due to her fear that if she decreases her mobility, she will completely lose her ability to get around.

She states that she fractured her right ankle in an motor vehicle accident approximately 20 years ago. She also had a history of DVT in her left lower extremity and a pulmonary embolism approximately 21 years ago following a hysterectomy. She has circulatory problems of both feet. She has had to have skin grafts on the left ankle. She has worn an Unna boot as recently as one year ago.

She also states that she has a seizure disorder and here, in the Physical Therapy Clinic during the evaluation, she stated that she felt she was having a mild seizure and became quite shaky, and her gait was more ataxic and she required to sit down and rest for approximately five minutes.

OBJECTIVE:
With general observation, she has difficulty rising from a low chair and has an antalgic gait, favoring the right lower extremity. She maintains a flexed posture at the waist and complains of increased low-back pain when extended to fully upright position. Her pelvis is level at the iliac crest. She does have a thoracic scoliosis with a right-sided convexity.

Upper extremity range of motion is within functional limits. With her lower extremities, she has -5 of dorsiflexion of the right ankle
and 0 of dorsiflexion of the left ankle, measured in a sitting position. In standing, she has 0-10

dorsiflexion on the left and 0-5 dorsiflexion on the right. She also has limited dorsiflexion of the great toe bilaterally; approximately 0 on the right and 0-5 on the left. Actively, she has weakness of toe intrinsics and has only trace abduction and poor toe extension.

Hip range of motion is limited with internal rotation on the right side at 0-10 compared to the left side, which is 0-30.
Lower extremity strength is grossly 4+/5 except for the toe intrinsics bilaterally. Her standing balance was poor with static standing, but improved with dynamic walking or weight shifting.

She denies any falls and is resistant to using an assistive device.

I did have her walk with a cane, here in Physical Therapy and this is when she started having increased ataxia and stated she felt that she was having a mild seizure, so this was discontinued.

ASSESSMENT:
Physical therapy problem list includes decreased range of motion of the low-back, hips, and ankles; right greater than the left side. She also has limited toe motion. Most functionally significant is the weakness of the intrinsic muscles and hallux rigidus. She also appears to have decreased proprioception, which affects her static standing balance.

PLAN:
During today's appointment, she was set up on a series of stretches to the lower extremities and low-back. She is to do these twice a day. I have a follow up appointment with her in one week, where at that time light strengthening exercises will be started, including lumbar stabilization and ankle strengthening. Also at that appointment increased emphasis will be on evaluating the possibility of using an assistive device or adaptive equipment at home, such as grab bars or bath bench.

Short-term goal will be that she will be independent with her home exercises and report less pain with walking in her normally daily activities within two weeks. She
will be able to rise out of a low chair without any increase in her pain and without assistance of her upper extremities.

Long-term goal will be maximizing her mobility without exacerbating her low-back or hip pain.

The length of this session was one hour.

ICD-9 code is 724.2 and 719.45.

01/11/99
LEFT WRIST EXTENSOR TENDINITIS
S:The patient was well until one week ago when, while dorsiflexing her wrist, she developed acute pain. There was no direct trauma, and she had not fallen. She subsequently developed swelling over the dorsum of the wrist. She applied ice, which helped with the swelling, and she also purchased a wrist splint. Again there was no direct trauma.

O:Examination reveals tenderness over the dorsal tendons of the wrist. The pain is worsened by passive flexion and by active dorsiflexion. There is no pain on axial loading and no tenderness over the radial or ulnar styloid processes or in the anatomic snuff box. Sensory examination and strength intact. Good perfusion of the hand. There are no ecchymoses.

A:Wrist extensor tendinitis.

P:Would continue to use wrist splint, ice prn. Would avoid overuse of nonsteroidal anti-inflammatory medications to avoid gastrointestinal irritation in this patient who is on Coumadin. Reevaluate in three weeks.

DEGENERATIVE JOINT DISEASE, RIGHT HIP
HISTORY OF RIGHT ANKLE FRACTURE IN DISTANT PAST
S:See prior Family Medicine Clinic note. Patient had radiographs of the right hip which showed degenerative joint disease. Her past history in that extremity is significant for right patellar fracture and x-rays in 1994 showing talonavicular osteoarthritis. She has also had history of low back pain since 1994 and had lumbosacral spine films showing degenerative joint disease of the lumbosacral spine. The hip discomfort is impairing her sufficiently now that she is impaired in being able to walk as much as she would like, although she reports that she continues to try to walk a few miles each day.

O:No repeat examination. See examination dated December 4, 1998.

A:1.Right hip degenerative joint disease.
2.History of low back pain, chronic, recurrent.
3.Right ankle osteoarthritis and history of fracture in the distant past.

P:She clearly needs and would benefit from physical therapy to the ankle,
hip, and low back. She is sent for physical therapy, then will follow up with me in three weeks.

FAMILY MEDICINE CLINIC

PROBLEM: SEVERE COGNITIVE IMPAIRMENT
S:Jean is a 73-year-old patient of Dr. William Neighbor's who is not well known to me. She has multiple medical problems including seizure disorder, recurrent DVT's for which she is on Coumadin and a history of severe cognitive impairment. Jean states that she has severe pain in her right leg but also explains that this clinic appointment was made by her "social worker". Prior to the clinic appointment, our nurses were contacted by her visiting nurse, who requested an evaluation for depression as Jean has revealed to her that she frequently cries. There has also been some question about her cognitive ability in terms of being able to track appointments. An evaluation of these concerns was requested.

Jean acknowledges that occasionally she does feel unhappy about things in her past, particularly about marrying the wrong man and her subsequent unhappy marriage. She states that at night "everything comes back". However, she believes that she functions very well in her home throughout the day. She denies episodes of tearfulness. She reports that her moods are okay and she would never consider "doing anything drastic." When questioned further, she elaborated that she would never consider hurting herself. She reports good energy and states that she walks at least six miles during the day. She notes that her concentration is sometimes problematic for her. She describes difficulty completing tasks and sometimes difficulty following a train of thought. She has good appetite. She sleeps six to eight hours per day, which is usual for her. She denies any suicidal ideation. She reports that she receives support from her neighbors; however, she states that she is not close to her children or her grandchildren although she does see them "once in a while". She lives by herself with her two cats in her apartment and believes that she is doing just fine.

The patient was evaluated by Dr. Ed Walker
in 8/96. He reported that she had neuropsychological testing in 1985 and was found to have a full scale IQ of 72 with broad severe cognitive impairment in most levels of her functioning, which was consistent with longstanding organic brain damage.

O:Appearance: The patient is well groomed and neatly dressed. Her affect is appropriate to content. Her thought process is extremely tangential, loose and disorganized. Her responses are frequently off target to the questions asked. She speaks without latency with a often circumstantial thought process. She was oriented times three; however, unable to complete most tasks, which required some concentration. She was unable to spell world backwards. She could count the months of the year backwards only until October. She interpreted the proper people in glass houses should not throw stones as meaning "leave them alone." She was not able to repeat 3/3 objects immediately. Could only repeat two immediately.

A:Jean is a 73-year-old woman who has undergone extensive psychologic testing in the past. Jean is not at all well known to me; however, it would seem that her exam today is consistent with prior evaluations. She does not endorse neurovegetative signs of depression; however, she is extremely disorganized in her thought patterns which would be consistent with a severe cognitive impairment and an IQ of approximately 72. From my examination today, it does not seem that further testing is warranted. However, if there are more questions, she should probably be re-evaluated by Dr. Bill Neighbor, who has been her primary care provider for the last several years.

PROBLEM: RIGHT HIP PAIN
S:Initially, Jean complained of foot, knee and thigh pain. However, upon further questioning, she localized most of her discomfort to her right hip and inner thigh region. Jean denies any recent trauma; however, she reports that her hip is sometimes so painful that she has almost fallen down. She also finds that it helps
if she pushes on her anterior thigh when walking, this helps to alleviate some of the discomfort. Jean has not had any recent fevers but believes that she may have a "pinched nerve" or that she may in fact have osteoarthritis. She has been taking ibuprofen 600 mg at least three times a day and has been using warm packs on her thigh region.

O:VITAL SIGNS: Weight 160 lbs, blood pressure 124/74 with a pulse of 68. PHYSICAL EXAMINATION: Approximately 10 cm region which Jean has drawn with a ball point pen on her inner thigh. She states that she believes that this region is swollen. However, to my examination, there is no edema and this leg seems symmetric with the left. There is slight pitting edema over her calves bilaterally. There is no erythema over her hip region. Jean obviously moves with some difficulty; however, when I am not observing her, her gait seems to be less painful. Physical examination reveals extremely limited internal and external rotation to approximately 150 to 20 bilaterally. Hip flexor strength is 5+= and hip abduction strength and adduction strength is also 4+/5=bilaterally. Sensation appears to be intact throughout both lower extremities. Right hip films reveal an osteophyte of the inferior femoral head consistent with osteoarthritis with minimal joint space narrowing. No evidence of fractures.

A:Right hip osteoarthritis.

P:1. Discussed with Jean that she could continue her Motrin 600 mg po qid as she tolerates it.
2. Encouraged warm packs to the hip region.
3. If her symptoms are not improved in two weeks, she should return to clinic for more evaluation.

PACIFIC STREET
SEATTLE, WASHINGTON 981

11/18/98
FOLLOWUP RIGHT FOREARM SWELLING
S:See note dated October 30, 1998. Patient reports no change in symptoms. There has been no worsening and no swelling distal to the proximal portion of the volar aspect of the right forearm. She believes, in retrospect, that this is simply related to carrying a heavy load with that arm.

O:Examination from October 30, 1998 was reviewed, and examination today repeated is exactly the same and unchanged.
A:Right forearm swelling distal to the antecubital fossa which is probably secondary to a muscle strain. Again I find no evidence that this is venous stasis or phlebitis about which we would be concerned in this individual who has a history of recurrent deep vein thrombosis in the lower extremities.

P:She should continue to use warm moist packs, avoid repeat straining of the arm, and follow up if it worsens. Otherwise, I would like to see her back in two months. If she still has swelling of that area, then I would obtain additional radiological evaluation such as a limited MRI of that area.

WILLIAM E. NEIGHBOR, MD

WN:11/18/98DMX/as:11/18/98

10/30/98
RIGHT FOREARM SWELLING
S:See note dated October 5, 1998. The patient has used warm moist packs and noted little, if any, improvement. However, the problem is not bothersome to her. There has been no injury that she can think of, except that she does carry heavy packages and groceries frequently, which causes pain in the area, and she suspects that she may have strained her forearm a few weeks ago.

O:Examination of the right arm reveals diffuse swelling over the ventral surface of the proximal forearm in the area of the two bellies of the brachioradialis. Swelling is essentially unchanged from last examination. Comparison of extremity circumference in this right-handed individual shows 1 cm discrepancy between the right and the left over the point of maximal diameter of the forearm and upper arm; however, there is no edema, and there is no swelling of the hand or at the wrist, and wrist circumferences are equal. There is no venous engorgement more apparent on one side than on the other, either.

Her x-rays done at her last visit had shown soft tissue swelling but otherwise nothing of significance.

Again examination of her axilla is unremarkable without adenopathy. As previously noted, mammogram was negative in May 1998.

A:Right forearm swelling distal to the antecubital fossa which is probably secondary to muscle strain. There is no evidence of bony process on x-ray. Certainly we must consider venous stasis/phlebitis in this individual who has history of recurrent deep vein thromboses in the lower extremities; however, the findings described above do not suggest venous engorgement or deep vein thrombosis in the upper extremities. She has also been adequately and fully anticoagulated.

P:Would follow at this point. May continue to use warm moist packs. Report any worsening or other symptoms. Return in two to three weeks. She is given a flu vaccine today.

10/05/98
RIGHT FOREARM SWELLING
S:The patient has noted nonpainful swelling just distal to the right antecubital fossa for the last month. Does not recall any specific injury, although her memory for these kinds of events in the past has proven to be poor.

O:Examination of the right arm reveals diffuse swelling over the two bellies of the brachioradialis. The swelling is in the area just distal to the right antecubital fossa. Comparison to the left shows that the bellies of the brachioradialis muscles just seem to be more prominent on the right than the left. The remainder of the forearm examination is unremarkable. There is no axillary adenopathy and no evidence of infection in the hand or forearm.

A:Right forearm swelling distal to the antecubital fossa is probably just prominence of muscle secondary to muscle strain; however, need to rule out other soft tissue process.

P:Soft tissue films ordered today, and patient to follow up in 4 to 6 weeks. She is to use warm moist compresses in the interim.

ADDENDUM: I have not seen this patient since January 1998. She is part due for total cholesterol which will be ordered at her next visit. She was seen in gastrointestinal clinic for dysphagia and gastroesophageal reflux disease and was found to have a stricture. There was no evidence of Barrett esophagus, and she had dilation for the stricture. She has been treated with omeprazole 20 mg bid, which she has discontinued. She now reports no problems. Mammogram in May was negative. The patient failed to return for physical examination in June as planned. She is due for sigmoidoscopy at some time. Will discuss these issues with her at her next visit. I will also write a letter to the telephone company to see if we can secure a phone for her, although she has limited financial resources.

FAMILY MEDICINE CLINIC NOTE
09/04/98
This patient is seen with Dr. Sue Runyan.

S:Jean is here today with a complaint of left mid back pain of approximately 2-1/2 weeks duration. She can relate no direct episode which precipitated this back pain but denies any trauma to the area. She denies any radiation of the pain into her buttocks or legs, any change in urinary or bowel habits, any loss of strength or coordination of her lower extremities, or night pain. She states that it is most painful when she actually moves, such as when she gets up from a chair. It has not greatly effected her daily activities as she is still able to walk from the store with bundles, but she does have to stop for most rest periods on her way home.

She has tried both ibuprofen and Tylenol without any relief of her discomfort. She states that she had an x-ray in 1994 which was negative for any problems.

She had a hysterectomy and bilateral salpingo-oophorectomy in 1971 and was on hormone replacement for only a short period of time. She has not had any studies to assess bone density and has not been on any therapies to supplement for bone loss.

O:MUSCULOSKELETAL: On examination her gait is somewhat guarding but she has full range of motion without any real abnormalities. She is able to rise up from a chair slowly but is in mild discomfort. There are no bony abnormalities to the spine although she does have mild scoliosis. There is a pinpoint tenderness lateral to the erector muscles on the left-hand side. It seems to be somewhat over the belly of the latissimus dorsi. There is no pinpoint tenderness over the spinous process. Straight leg raise is negative bilaterally. Deep tendon reflexes are 2/4 and symmetrical at the patella and Achilles bilaterally. Strength of the quadriceps, gastrocs, and anterior tibialis are 5/5 bilaterally and symmetric. Sensation is grossly intact to light touch and to temperature. She does have ulcers on both legs with the left being worse than the right.
She states this is a longstanding condition. Figure-4 tests of sacroiliac tenderness is negative. There are no bony abnormalities of the lower extremities.

A:Probable mid back sprain. Other etiologies such as compression fractures, cancer, or thoracolumbar herniation are unlikely given her symptoms and negative physical examination. Back x-ray in 1994 was remarkable only for a degenerative joint disease.

P:1.Mid back sprain. I have instructed Jean that this probably get better progressively over time. I have told her that the best thing for her to do is mild to moderate aerobic activity as she can tolerate. I have also advised that she perhaps not carry heavy bags back and forth to the store until she is feeling much better. I have reassured her that giving her narcotics could only prolong and possibly

exacerbate the current situation. She understands this and will try her best to continue with good aerobic activity.
2.Hormone replacement/osteoporosis. In reviewing Jeans chart, it seems that she may benefit from an assessment of her bone density. She stated the reason for stopping her hormone replacement originally was because of the risk of thrombosis. I believe that this issue should be revisited at her next physical, and I have advised her to schedule a full physical examination with her primary care physician at her earliest convenience.

FAMILY MEDICINE CENTER CLINIC NOTE

S:Seborrheic keratoses and possible actinic keratosis. The patient is a 72-year-old woman with multiple medical concerns, who presents to clinic today stating that she noticed "black things" on her back two weeks ago at her mammography appointment. She believes that she saw them again a few days ago and wonders if she has bugs. She has no itching on her back. She has no prior history of moles or skin cancer. The patient also mentions that on her left dorsal wrist, there is a spot that she has just noticed in the last couple of months, which she believes looks like worms. She wonders what this is.

O:VITAL SIGNS: Weight of 157 lb, blood pressure 136/80, pulse 80. SKIN: The back is notable for scattered seborrheic keratoses, all completely benign appearing. There is no evidence of insects or rashes. The left dorsal wrist is notable for a 7 x 8-mm actinic keratosis. This area is a slightly hyperpigmented region that is also benign appearing.

A:Seborrheic keratoses and actinic keratosis.

P:1.Patient reassurance was given that the lesions on her back are benign. There is no evidence of bugs.
2.The patient will continue to watch the lesion on wrist. If it increases in size or she has further concerns, she can present to have it reevaluated.

FAMILY MEDICAL CENTER CLINIC NOTE
PROBLEM:ANTICOAGULATION FOLLOWUP
S:The patient returns to the clinic today in preparation for her dental visit which unfortunately was canceled. She has been taking Coumadin 5 mg Tuesday, Thursday and Saturday; 10 mg the rest of the time. She did skip her dose last night in preparation for the dental appointment. She does not have any complaints of bruising or bleeding.

O:INR today 1.3.

A: Anticoagulation. The patient has INRs between 2 and 3 for recurrent deep venous thrombosis. This would be expected as she has held the dose for her dental appointment.

P:Continue with Coumadin 5 mg Tuesday, Thursday and Saturday; 10 mg the rest of the time. As her dentist canceled his clinic today she has an appointment rescheduled in two weeks at which time she will hold the dose the night before and have her pro time rechecked at that time.

PROBLEM:Anticoagulation follow up.

S:The patient dropped in for re-check of her pro time and INR. She has been taking Coumadin, 5 mg Thursdays and Sundays, 10 mg the rest of the time. She reports no problem with bruising or bleeding. She has not had any further dental surgery and has no complaints with her anticoagulation at this time. She brings in her box today. The patient appears to be adherent to the medications.

O:INR today 3.3.

A:Slightly supertherapeutic anticoagulation. The patient has goal INRs between 2 and 3.

P:Will decrease Coumadin slightly to 5 mg Tuesdays, Thursdays and Saturdays and 10 mg the rest of the time. Will recheck in one month's time.

KAREN GUNNING, PHARMD

PROBLEM:Anticoagulation follow up phone call.

S:The patient returns to clinic for anticoagulation follow up phone call. The patient returns to the lab today for re-check of her pro time INR. She has been taking Coumadin, 5 mg Thursday and Sunday, 10 mg the rest of the time. She has restarted this medication after having dental surgery on the 25th, therefore she has taken two 5 mg doses and two 10 mg doses. She has not had any problems with bruising or bleeding. She has not had any problems with pain in her legs. She has not added any new medications, increased any doses or missed any doses, per her report. She does not have her Mediset here for inspection. She says that she has been compliant since re-starting her medications.

O:INR today 1.3.

A:Subtherapeutic anticoagulation of patient's who goal INR is between 2 and 3.

P:As the patient is prone to dramatic swings in INR with increases in dose, we will sit tight and keep the dose at 5 mg Thursday and Sunday and 10 mg the rest of the time and we will re-check in two weeks time. She does not have any dental procedure planned for at least another month.

GASTROENTEROLOGY CLINIC NOTE

SUBJECTIVE:
This is a followup visit for this 73-year-old woman with a history of dysphagia and a long history of heartburn. The patient underwent an upper endoscopy with dilatation on 03/11/98. At that procedure her distal esophageal stricture was found and dilated up to 45 French with Savary dilators. Biopsies from the site showed mild chronic inflammation. There was no evidence of Barrett's and there was no evidence of malignancy. The patient has been on omeprazole 20 mg per day. Following the dilatation, her dysphagia has improved. Her reflux symptoms continue despite the omeprazole, although it is much improved. At times she needs to take omeprazole twice a day, but on most days once a day is sufficient. The patient has no new GI complaints today.

OBJECTIVE:
Weight 67.5 kg, blood pressure 110/62. In general this is a pleasant woman in no acute distress. No physical examination was performed today.

ASSESSMENT & PLAN:
Dysphagia secondary to peptic strictures status post dilatation. The upper endoscopy and biopsies did not show any evidence of malignancy. The patient was counseled regarding antireflux measures. She should also chew her food well, especially when she is eating meat. She should continue taking the omeprazole at 20 mg po q day. If her symptoms persist, in the future the dose may be increased to 20 mg bid. Her coumadin will need to be readjusted accordingly as the omeprazole may change her INR. In the future if her dysphagia becomes more problematic, then a repeat upper endoscopy with dilatation can be performed. The patient will follow up with Dr. Neighbor in Family Medicine Clinic and return to the GI Clinic prn. Time spent with the patient was 30 minutes.

EMERGENCY MEDICINE SERVICE NOTE - ATTENDING ADDENDUM

CHIEF COMPLAINT: Seizure

The patient was seen with Dr Christopher Flowers. The resident's H&P was reviewed, and I interviewed and examined the patient. Please see the resident's note.

Briefly, this is a 27-year-old female who has a history of a seizure disorder who was having a tooth pulled when she had a seizure in the dental clinic. We were called over to see her and brought her to the Emergency Department for further care. Upon our arrival in Dental Clinic, we noted that she was having nonpurposeful movements of all four extremities. She did not seem to be awake and alert. These stopped on their own and she was extremely groggy after this. No other history was obtainable.

PAST MEDICAL HISTORY:
Significant for deep venous thrombosis, seizure disorder, glaucoma, gastroesophageal reflux.

CURRENT MEDICATIONS:
Coumadin, Tegretol, lovastatin and Trental.

ALLERGIES: PENICILLIN, SULFA

SOCIAL HISTORY: We were unable to obtain.

REVIEW OF SYSTEMS: Also unobtainable.

PHYSICAL EXAMINATION:
VITAL SIGNS: Stable. She was lethargic and post ictal. Pupils equal, round and reactive to light and accommodation. Extraocular movements intact. She had no gaze preference. Fundi were normal. TMs were normal. NECK: Supple with full range of motion. There were no carotid bruits. LUNGS: Clear to auscultation bilaterally. Heart sounds were regular without murmurs or gallops. ABDOMEN: Soft. NEURO: She was lethargic but moved all four extremities equally to painful stimulus. Deep tendon reflexes were 2+, symmetrical.

ED COURSE
The patient did have another seizure while she was here in the ER which was witnessed by all the staff. An IV line was established. However, the patient's seizure activity abated before we were able to give her any medication. We did do a CT scan of her head because of the history of Coumadin

use, and this showed no bleed. Tegretol level as well as basic labs were all within normal limits. Her INR from this morning as drawn in clinic was 1.9. By the time she got back from CT scan, she was feeling much better. She was awake and alert and had a completely normal neurologic exam and mental status. We discussed the case with the Family Practitioner since she is followed by Family Practice and we will discharge her home.

FINAL DIAGNOSIS: Seizure disorder.

CELLULITIS NEAR RIGHT ORBIT:
S:This is a 74-year-old woman who began noticing redness near her right eye approximately one week ago. The patient states that there is a scab on her forehead, but does not know where the scratch came from. She states her vision has not changed and she has an upcoming appointment in the Eye Clinic to change prescription on her glasses. The patient states her eyes are sensitive to light, but this is not a new finding for her. She does not have pain when moving her eyes in various directions. The patient states she has an ALLERGY TO PENICILLIN AND SULFA DRUGS which both give her a rash. She has taken first generation cephalosporins in the past without difficulty.

O:Weight 149 lb. BP 130/70. Pulse 80. HEENT: Normocephalic with small scratch with well-healing scab on right forehead. Area of erythema extends from the scab which encircles the right eye. The patient does not have swelling of eyelid. No proptosis. EOM's are intact and without pain with movement. Funduscopic exam is benign. No fluctuance under area of erythema. No lymphadenopathy detected. HEART: Regular rate and rhythm with 2/6 murmur, left upper sternal border. LUNGS: Clear to auscultation bilaterally.

A:Cellulitis of right forehead and surrounding right eye. Findings not consistent with periorbital cellulitis or cavernous sinus thrombosis.

P:The patient was given a prescription for 250 mg po qd, Keflex times 10 days, and to follow up in the next five days if erythema is not improving. This patient was seen and examined with attending physician, Doctor Tom Norris.

ANTICOAGULATION FOLLOW-UP

S:Patient dropped in to notify us that she had had a pro time done on the 11th while in Endoscopy Clinic. She at that time had an EGD at which time a biopsy was taken of an esophageal stricture. She was told at that time to resume taking her Coumadin on 03-12-98. She had held her Coumadin for three days prior to the procedure.

O:INR on 03-11-98 1.0.

A:Subtherapeutic anticoagulation of patient being anticoagulated for multiple DVTs. She has held Coumadin for three days.

P:Patient will re-start Coumadin at the dose she had been taking previously, which was 5 mg on Thursdays and Sundays, 10 mg the rest of the time.

Of note also looking at her future clinic appointment, she had a dentist appointment on 03-25-98. Upon talking with the dental clinic she is scheduled for an extraction. They would like to have her INR be between 2 and 3 in order to do the extraction. We have agreed with them and with Jeanne that she will hold her dose of Coumadin one day before on 03-24-98 and resume the evening after or as directed by Dental.

In addition she will check her INR on 03-25-98.

PROCEDURE:#31031

REFERRING PHYSICIAN:Rahul Kuver, MD
Division of Gastroenterology

PROCEDURE NAME:Esophagogastroduodenoscopy with dilatation.

OPERATORS:
Richard Tobin, MD, Attending Physician
Elizabeth Morrison, MD, Fellow in Gastroenterology

ENDOSCOPY INDICATIONS:
Dysphagia to solids for one year. No weight loss. Long-term history of heartburn.

MEDICATIONS:
Demerol, 50 mg; Versed, 5 mg IV in divided doses.

CONSENT:
The patient was advised regarding the risks of the procedure, including but not limited to bleeding, perforation and aspiration, and informed consent was obtained.

PATIENT MONITORING:
Patient monitoring included continuous clinical assessment, blood pressure, EKG and pulse oximetry. All parameters remained within normal limits.

DESCRIPTION OF PROCEDURE/FINDINGS:
Please note, Doctor Tobin was present and guided throughout the procedure. The patient was placed in the left lateral decubitus position and the esophagus was intubated under direct vision once conscious sedation was attained. The endoscope was advanced to the duodenum without difficulty. There was a distal esophageal stricture noted at 32 cm, through which the endoscope passed with ease. A hiatal hernia was present from 32 to 35 cm. The duodenal bulb and first and second portion were normal. The gastric mucosa was without abnormality. Retroflex view confirmed hiatal hernia and a stricture.

The esophageal stricture was biopsied times two, although its appearance was that consistent with a peptic stricture. The remainder of the esophagus was normal. A wire was advanced through the endoscope, into the antrum, after which the endoscope was withdrawn from the patient. Dilation of the stricture was performed using a 38 French, followed by 42 and lastly 45 French Savory dilators.

The 45 French had minimal resistance. There were no complications. The dilator and the wire were withdrawn from the patient, following dilation with the 45 French tube.

IMPRESSION:
Likely
peptic stricture, however, biopsies taken. No evidence of Barrett's.

PLAN:
Given patient's age and sedation late in day and no available ride home, the patient will be admitted for overnight observation limited stay on 8 South. The patient may resume her Coumadin beginning 3/12. The patient will follow up with Doctor Kuver.

ROOSEVELT FAMILY MEDICAL CENTER
CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

ANTICOAGULATION FOLLOW UP PHONE CALL:

SUBJECTIVE:
The patient dropped into clinic today for blood pressure check of protime INR. Has been taking coumadin 12.5 mg Tuesday and Saturday, 10 mg the rest of the time, and has been compliant, per medi-set check, as well as per patient report. Of note, has added Omeprazole as of last visit here, which may cause an increase in protime and INR. She has not had problems with bruising or bleeding, and in fact remarked that when her blood was drawn, she thought her blood would be too thick because it did not bleed at all. Has not had any nose-bleeds, does have a scratch on her hand, which was caused by a dog and has not bled at all.

OBJECTIVE:
INR today 5.7.

ASSESSMENT:
Super therapeutic anticoagulation on patient who is INR is between 2 and 3 for recurrent deep venous thrombosis.

PLAN:
The patient will hold coumadin for two days, resume with 5 mg on Thursday, and Sunday, 10 mg the rest of the time. Has appointment scheduled with Dr. Neighbor on Tuesday the 24th. Will recheck protime at that time. Is to call should she have trouble with excess bruising or bleeding. Suspect that improved compliance with mini-set, as well as increased addition of Omeprazole which could increase the INR may have resulted in this bump, and have readjusted the dose down 20% accordingly.

ROOSEVELT FAMILY MEDICAL CENTER
CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

RECURRENT THROMBOPHLEBITIS, ANTICOAGULATION; GERD
S:The patient is scheduled for review of protime despite increasing doses over the past couple of visits. The patient's pro time has remained subtherapeutic. She was provided with a mediset at the last visit. She was asked to increase her dose 20% and follow back shortly for fear that assisted adherence might set up a super therapeutic effect from the Coumadin. She continues to claim excellent adherence to the regimen. She has been taking 10 mg each day and then on Tuesday, Thursday, and Saturday an additional 2.5 for a total of 12.5 on those three days. She had no problems with bruising or bleeding or recurrence of thrombophlebitis. She has had some difficulties with GERD, and was recently seen by the gastroenterologist who scheduled an upper endoscopy which, in his opinion, will require hospitalization and heparinization in case biopsies and dilatation are necessary. Until this can be organized, prescription or omeprazole 20 mg daily was prescribed.

O:Prothrombin time as INR 3.3.

A:1.Anticoagulation, slight hypoprothrombinemic effect (doubt this is all the dosage increase, probably some degree of improved adherence as well).
2.Potential drug interaction between omeprazole (omeprazole inhibits CYP2C9 mildly and accounts for slight elevation in prothrombin time, at least in some individuals).

P:Will reduce Coumadin to 10 mg each day and then 12.5 mg on Tuesday and Saturday. Will have her return in two weeks to continue to monitor the effect of the mediset on her adherence and the effect of omeprazole before going back to a monthly schedule.

GASTROENTEROLOGY CLINIC NOTE

CCID:
This is a 27-year-old woman referred regarding solid food dysphagia.

HISTORY OF PRESENT ILLNESS:
The patient complains of dysphagia for solid foods times approximately one year. There are times when she is able to drink water and the dysphagia resolves. However, at other times she has had to regurgitate food. She denies having any liquid dysphagia. She also describes a history of heartburn which has been longstanding and present for at least three years. She has been taking Tums prn for this, and this has often been adequate to control her heartburn symptoms. She briefly tried an H2 blocker, but did not think that this alleviated her symptoms sufficiently. Her heartburn tends to occur after she eats. She has not had a problem with dysphagia with her medications. She has not had any documented weight loss and she does not have any nausea, and the dysphagia has not been progressive as far as she can tell. She also complains of a vague, dull, upper abdominal ache which is present the majority of the time. Her bowel movements have been normal and there has been no gross evidence of blood in her stools. She denies any early satiety. She has a poor appetite, but as noted above, her weight has been stable.

The patient is on Coumadin for a history of recurrent DVT. The patient also had a barium swallow done in 1991 which showed a hiatal hernia and thickened antral folds which were felt to be consistent most with a prior ulcer disease. There was also eventration of the right hemidiaphragm noted on the upper GI study.

ALLERGIES:
NO KNOWN DRUG ALLERGIES.

MEDICATIONS:
1.Zocor.
2.Carbamazepine.
3.Pentoxifylline.
4.Coumadin.PAST MEDICAL HISTORY:
1.Glaucoma.
2.History of seizures.
3.History of lower extremity skin grafts for stasis ulcers.
4.Status post hysterectomy.

SOCIAL HISTORY:
The patient does not smoke and does not drink alcohol. She is a widow.

FAMILY HISTORY:
Noncontributory. There is no family history of malignancies.

REVIEW OF SYSTEMS:
Unremarkable. She has no dyspnea on exertion or orthopnea. She has no chest pain. She has no cough. She does not have insomnia.

PHYSICAL EXAMINATION:
Blood pressure 116/70, weight 147 lb. GENERAL: This is a well-developed elderly woman in no acute distress. She is alert and oriented times three. She does not appear acutely ill. She looks quite well for her stated age. HEENT: Atraumatic and normocephalic head. Pupils are equal, round, and reactive to light and accommodation. Extraocular movements are intact. Anicteric sclerae. Oropharynx is clear without lesions or exudate. NECK: Supple without adenopathy and without thyroid enlargement. LUNGS: Clear to auscultation. CARDIAC: S1 and S2, regular rate and rhythm, without murmurs, rubs, or gallops. ABDOMEN: Soft and nontender without masses. There is no hepatosplenomegaly. Positive bowel tones. RECTAL: Normal sphincter tone. No perianal lesions. Stool is hemoccult negative. EXTREMITIES: Evidence of skin grafts. There is no edema.

LABORATORY DATA:
Laboratory values from January 27, 1998, show ALT of 8, AST 12, prothrombin time 17.8, and cholesterol 284.

ASSESSMENT AND PLAN:
This is a 72-year-old woman with a long history of heartburn who complains of dysphagia for solids which has been present for approximately one year. There is no documented weight loss and the nonprogressive nature of this dysphagia suggests a Schatzki's ring rather than a malignancy. Regardless of the underlying diagnosis, the patient requires an upper endoscopy in order to make the diagnosis as well as to provide therapy if indicated by the findings. Due to her anticoagulation for recurrent DVT, the patient will require hospitalization in order that heparin may be started prior to the procedure as her prothrombin time normalizes. We will need to coordinate this with the patient's referring provider, Dr. Neighbor. We anticipate performing an upper endoscopy once her prothrombin time has normalized. Biopsies may need to be taken and a dilatation may need to be performed if a ring is found in order to alleviate her symptoms. For these reasons it is not safe to proceed until her prothrombin time has come to the normal range and the patient is on full dose heparin. The heparin can be stopped immediately prior to the procedure and then restarted after the procedure.

I would also recommend giving her a trial of a proton pump inhibitor such as Omeprazole to determine whether some of her heartburn symptoms can be better controlled. Antireflux measures

were also discussed with the patient.

RECOMMENDATIONS:
1.I discussed with Dr. Neighbor regarding admission for heparinization.
2.Schedule upper endoscopy in coordination with the admission.
3.Trial of Omeprazole 20 mg per day.

ANTICOAGULATION FOLLOWUP

S:
The patient dropped by today for a recheck of her protime and INR. She has, by her report, been taking Coumadin 10 mg every day of the week except for Sunday, in which she takes 5 mg. We discussed in detail her system for remembering to take her medications. She takes her medications, carried them around with her, and is able to very nicely able to recite exactly when she takes the medications. She denies missing doses. She does report that one time over the past month she did double up on a dose of her Carbamazepine, but reported that this only occurred one time. She has not had any problems with bruising or bleeding. She does report pain in her legs when she walks, left greater than right, but this has not really changed over her previous presentation.

She is also taking the other following medications:
Trental 400 mg tid.
Carbamazepine 200 mg tid.
Simvastatin 10 mg q hs.
Some eye drops.
Occasional Tums.

She does not report taking any other medications and is not carrying any others with her at this time.

O:
INR today was 1.5.

A:
Continued subtherapeutic anticoagulation despite recent dose increases.

P:
Have provided the patient with a Mediset set up with her for the first week. She verbalizes her understanding and how to set it up for next week. An appointment has been set for next Thursday with Doctor Ellsworth to review her anticoagulation as well as review

her compliance package. She will call if she has any questions in the meantime.

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

FAMILY MEDICAL CENTER CLINIC NOTE

FOLLOWUP BRONCHITIS
S:Treated with Zithromax in December and returns for followup on bronchitis. She is currently asymptomatic except for suffering from intercurrent sore throat related to recent upper respiratory infection.

O:Afebrile, in no acute distress. CHEST: Completely clear except for mild coarse crackles at the left lower base which were present in September of 1996, at which time, chest x-ray was unremarkable.

A:1.Bronchitis, resolved.
2.Chronic left lower base crackles, probably secondary to fibrotic changes.

P:No need for further followup on this problem.

HEALTH MAINTENANCE
S:Hemoccults were negative in April of 1997. The patient has not had sigmoidoscopy but is advised to have this at this time. However, mammogram was done in April and was normal.

DYSLIPIDEMIA
S:She is due for total cholesterol testing and liver function tests, given treatment with lovastatin and follow up in six weeks with me.

DYSPHAGIA AND GASTROESOPHAGEAL REFLUX DISEASE
S:The patient with long history of gastroesophageal reflux disease, last seen by me in April of 1997, at which time, she was treated with a course of Axid and instructed to follow up and, if persistent symptoms, would consider esophagogastroduodenoscopy. She did not follow up as instructed with me. On review of her records in February of 1991, barium swallow revealed hiatal hernia with reflux and additionally eventration of the right diaphragm. The patient reports a long history of dysphagia and states presently that food seems to stick in the mid esophagus, and she needs to drink extra fluids to wash the foods down. She is occasionally using Axid for heartburn symptoms.

O:The patient was in for a brief visit today to follow up on her cough, and there was inadequate time to complete abdominal examination.

A:Chronic gastroesophageal reflux disease symptoms and dysphagia in patient who has had no recent followup evaluation for this problem since
approximately 1991. In part, this has been related to her lack of follow-through.

P:Refer to Gastroenterology Clinic for consideration whether to pursue barium swallow followed by

esophagogastroduodenoscopy or simply to do EGD. The patient understands the reason for the referral.

ANTICOAGULATION FOLLOW UP

S:The patient in to see Dr Neighbor today for followup of bronchitis. She has been taking since her last visit Coumadin 10 mg daily except for 5 mg on Saturday and Sunday. She has completed her course of azithromycin and has not had any new medications added to her regimen. She does not have any complaints of bruising or bleeding and has been doing well except for continuing symptoms of bronchitis. She states that she takes her medication every evening, had her bottles with her. We went over, pill by pill, what she takes, and it appears she is compliant.

O:Prothrombin time today 18.6 seconds with an INR of 1.6.

A:Subtherapeutic anticoagulation with the patient being treated for recurrent deep venous thrombosis.

P:The patient will increase medication to 10 mg qd and 5 mg on Sunday. There appears to be no rationale for her continued decrease in prothrombin time which is exactly the same as it was when she was here previously. Will follow closely and have her come back in two weeks' time for recheck of her prothrombin time.

FAMILY MEDICINE CLINIC NOTE

S:MSW had met with the patient on 12/30/97. At that time, she stated she wanted some help finding low-income housing. Her son, Douglas, was to take her to a place on Queen Anne on Wednesday, 12/31/97. The patient states that she spends about three days a week over with Douglas on Bainbridge Island, and then spends the rest of the time with a friend in Mountlake Terrace. The number at Mountlake Terrace is 425-670-9712. The patient states that everything is in storage at this point, and she would like to get her own apartment. The patient requested Division on Aging case management. This morning, I called Mildred Dade, her social worker at Division on Aging at 684-0678, to explain that patient was living between two households and had requested help with low-income housing. According to Mildred, her son Douglas had said that he would take care of it and did not want any social agency involved. Therefore, the case was closed, this was back in 9/97. If the patient were to call Mildred, she would help her with the paperwork and put her on the list of low-cost housing. Therefore, I attempted to reach the patient this morning. I did call the Bainbridge Island number, 842-8360, of Douglas and left a brief message that I was trying to reach the patient. I then was able to reach the patient at the 425-670-9712 number. The patient was going to call Mildred Dade, as I gave her Mildred's phone number, to request an appointment to assist with paperwork and get on the low-income housing list. I will remain available as needed.

COAGULOPATHY, ANTICOAGULATION

S:The patient was seen by Dr. Shade for bronchitis and was given a prescription for azithromycin. Also had her prothrombin time checked, and felt like she is a little under-anticoagulated, though she has not made any dietary modification changes, as her feet are colder. She continues taking Coumadin 5 mg Monday, Wednesday, Friday, 10 mg the rest of the days.

O:LABORATORY DATA: Prothrombin time 18.6 seconds, INR 1.6.

A:Inadequate anticoagulation.

P:Increase Coumadin to 10 mg everyday, except Sunday, where she will take 5 mg. The azithromycin that she has ordered for her respiratory infection should not interfere. Will plan on followup in two weeks, just before she comes to recheck on the bronchitis.

12/30/97
COUGH X TWO WEEKS
S:The patient is a patient of Dr. Neighbor who is new to me today presenting with the complaint of productive cough x 2 weeks. She has a nagging cough productive of yellow and brown sticky sputum. Coughing is forced at night, and she is kept up much of the night. She is very fatigued during the day, and thinks she is having maybe some subjective fevers and chills. She has pain over her lower sternum and chest with coughing, and sometimes with deep breathing. Otherwise, no chest pressure, chest pain, no shortness of breath. She denies paroxysmal nocturnal dyspnea, orthopnea, or edema. She denies sore throat, ear pain, facial pain, or headache.

Current Medications:
1.Coumadin
2.Trental
3.Tegretol
4.Lovastatin

ALLERGIES: PENICILLIN AND SULFA.

O:VITAL SIGNS: Temperature 36.8 degrees, respirations 16, pulse 72, blood pressure 132/80. GENERAL: Mildly ill-appearing, elderly female in no acute distress. HEENT: The left tympanic membranes has a PE tube in place. Right tympanic membranes is pearly gray with good light reflex. Nasal mucosa shows some injection with no obvious discharge. Oropharynx is clear, not injected, no exudate. NECK: Supple without lymphadenopathy. Conjunctivae clear with tearing bilaterally. LUNGS: Bibasilar crackles which clear with cough, otherwise no rales or wheezes, no tachypnea. CARDIAC: Regular rate and rhythm.

LABORATORY DATA: INR pending.

A:Bronchitis.

P:1.Azithromycin Z-PAK x 5 days.
2.Check INR in two weeks to see that antibiotic does not affect Coumadin metabolism.
3.Recommended using lots of fluids and mist showers for cough control rather than over-the-counter cough suppressants.
4.Return to clinic in two weeks for repeat examination.

UNSCHEDULED VISIT REGARDING ANTICOAGULATION

S:The patient returned for routine prothrombin time monitoring several days ago. She is now in today to discuss the results. Her past dose had been 5 mg on Monday and Friday, 10 mg the rest of the days, trying to achieve a goal INR of 2.3. She has no bruising or bleeding problems. In fact, they had difficulty getting blood from her.

O:Prothrombin time as INR 4.3 (38.3 seconds).

A:Over anticoagulated, without complications.

P:Hold dose tonight. Restart Coumadin on Thursday at: Monday, Wednesday, and Friday 5 mg, 10 mg the rest. Will recheck to make sure we are stable at two weeks.

LEFT HIP PAIN

S:The patient comes in with a two-week history of left hip pain. She notes that she has been moving boxes at her home and is in the process of leaving her apartment, and it was during that time of onset of her symptoms. She states that the pain is in her hip, worse with walking and moving. It radiates down to her left calf. Denies any fevers or trauma.

O:Alert, anxious female in no apparent distress. EXTREMITIES: Left calf with mild tenderness to palpation as compared to the right. No positive thickening of the skin on the left calf consistent with chronic venous stasis changes. No swelling. No posterior calf pain with dorsiflexion. Pulses: Dorsalis pedis and posterior tibial are palpable bilaterally. No posterior knee pain. KNEE: No posterior knee pain. Full range of motion with no pain. No effusions. HIPS: Range of motion symmetric bilaterally. Pain initially on internal rotation, but that was inconsistent and not present on numerous other repeated examinations. No pain on external rotation. Positive reproducible pain over the greater trochanter. No erythema or warmth. Gait is normal bilaterally with mild favoring of the left side. Straight leg raise negative. BACK: With normal flexion, extension, and rotation to the left and to the right.

A/P:Left greater trochanter bursitis. The patient gave informed consent for injection of 1% bupivacaine of 4 cc and 1 cc of steroid injection. Minutes following the procedure, the patient noted marked improvement in her symptoms. Able to ambulate with no pain. Instructed the patient to continue with ibuprofen 600 mg qid with food for the next two weeks. Will have her follow up in one week's time to be certain her symptoms are not resolved and there are no further questions. She will follow up either with myself or her primary care provider, Dr Neighbor.The patient was seen and evaluated and injection performed with Ronald Schneeweiss, MD.

ANTICOAGULATION

S:The patient's PT came back at an INR of 2.6. The goal for this patient is between 2 and 3, given her history of deep venous thrombosis. Therefore she is over anticoagulated and likely needs a change in her Coumadin dose. Per the last report, her Coumadin was 10 mg qd except on Friday which was 5 mg. Likely needs a change to drop the Tuesday dose to 5 mg as well. However, tried the patient at home and there was no answer and no answer on the message machine. The patient does have a followup appointment on October 20, 1997. Therefore, hopefully, this issue will be addressed at this time. No further action could be taken today.

CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

After the events of last week, MSW did speak with the APS person who did go out and do a home evaluation. Her name is Denise Ross who can be reached at 626-5727. According to Denise, this case will be held open by APS. They are turning it over to the Division on Aging as well. There are some issues with the son who is living there, and when she was there she did see at least one person in the apartment. The manager will be changing the locks and they will be trying to contact the son on Bainbridge Island who currently is in Hawaii; his name is Douglas Hoffman. He will eventually be able to be reached at 842-8360.

At this point, the other issue is to perhaps get the patient into low income housing as her rent is more than her income at this time. The Division on Aging will take over case management for her at that point. Issues of the son are being dealt with also. Denise will be in touch with me as need be.

MSW will remain available as needed.

ROOSEVELT FAMILY MEDICAL CENTER
CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET

SEATTLE, WASHINGTON 98195

08/11/97

S:MSW asked today to see patient by Dr. Al Ellsworth. The patient is a 72-year-old white female who is in an apartment, Colonial Gardens, 14817 15th Ave. NE, apartment 24, with her son, Lewis, who is somewhere in his 40s. According to Dr. Ellsworth, the patient has a seizure disorder and has had a couple in the lobby when she becomes stressed. According to the doctor, she may be building up to one before I was seeing her this morning. The patient is hard of hearing, does read lips. MSW then met with patient who came into my room. The patient was fairly vague about some of the details I asked her such as how old was her son, "old enough to know better." Finally, she stated that he probably was in his 40s. The patient was able to produce documents giving her social security number and DSHS number, then we started to talk about what the problem was at the moment. According to patient, her son has brought home between three and four street kids, teenagers, who smoke, urinate, spill things, are eating all her food, sleeping all day, and in her apartment now for three to four weeks. At least one of the teens is a female. The patient states she has asked the kids to leaves and they will not. She has asked them not to eat her food, and she stated that she felt she was going crazy. She just could not take it any more with these kids there. MSW asked about the lease which is only for herself and her son Lewis. The patient states she called the police last night, but when a woman accused her of being drunk, she hung up. The patient is hard of hearing and has the seizure disorder. We talked about what avenues to take. I supported the patient in her right to have her apartment back, and indeed with only the two of them on the lease, these other teens should not be there at all. I called APS first at 626-5732 to report that I would like at some point to make a report. I was only able to leave a message stating that I wanted to get support for getting teenage street people
out of this elderly woman's home. We then called the police with patient agreeing to my call, and I finally spoke to operator 65 who stated that at this point from what I was described, there is no criminal act, therefore, she recommended that we work through the manager and see what he could do. I did ask the patient if I could call the manager, and the patient became quite worried about getting her son in trouble. I stated that as far as I could tell there would be no reason to get Lewis involved or in trouble as he was on the lease. I began to notice that patient's expression on her face had changed and her eyes had become fixed in a stare at me. Therefore, I secured the assistance of an MA and then we had quite a few folks helping us out. The patient had some sort of event, a seizure or I am not exactly sure what took place, but the patient became combative, probably disoriented, would only answer no to any question asked her, and indeed for a long time was essentially unresponsive. The patient finally became very agitated and began to pull pictures off the wall and push items off my desk. We called security and ended up actually calling the emergency response team to come to help with patient. At one point, the patient lost her balance and slid to the floor, but became combative again when asked about assistance. We were unable to administer any kind of sedative. The patient went against her will to be evaluated in the emergency room. In the mean time, I had called the MHPs who stated that given the fact that if she was being taken to the

ER, they would do an evaluation and perhaps be involved later on. I called this information to Maggie Yamanaca at 4222 at the ER. In the mean time, I have looked through the chart and found that Dr. Edward Walker saw the patient in August 1996. She evidently had a neuro evaluation which questioned the authenticity of the seizures. At some point in 1985, she had IQ testing which proved to identify her IQ as being 72. The patient
evidently states she had a high school education, but "got the lowest grades ever." According to Dr. Walker's note, the patient has a broad, severe cognitive impairment consistent with long-standing organic brain damage. No history of drug or alcohol use. Evidently, the patient has another son who is married. The patient was married for 25 years and then divorced. At this point, will be in touch with Maggie Yamanaca, and I will continue to try to reach APF folks to see about getting these kids out of the house and doing some protective interventions for patient. I will remain available as needed.

ACUTE ANXIETY

S:The patient was on Dr Ann Hawn's schedule and was actually seen by Dr Hawn initially but then transferred to me as her primary care provider when I had an opening this morning. She has been under a great deal of psychosocial stress in that her son, who is approximately age 40, lives at home and has multiple friends coming over. While her son is gay, she does not have a problem with that, but she does have a problem with their demanding attitude. She would like to get a smaller house where she can live just with her cats, and she thinks that her neighbor will help her in this. She was downtown yesterday, in part, because of the underlying stress when a kid threw a water balloon at her. She chased after him and kicked him, and then the police got involved. She comes in today tearful. Over the weekend, she reported having some suicidal ideation and even had a plan involving getting on a ferry and jumping off of it. However, today, she states that those thoughts have subsided and she is not having any further suicidal ideation. There are no delusions present.

O:VITAL SIGNS: Per chart. Tearful but controlled.

A:Acute anxiety with possible underlying depression, in part, related no psychosocial situation.

P:1.Offered our social work resources, but the patient feels she can deal with this on her own with the help of her neighbor at the present time, but I advised her to call us if there are any problems.
2.Since her main problem presently is an acute anxiety and there is no suicidal ideation, and we have known this patient for a long time, will begin oxazepam 10 mg one po tid prn number 20 given with no refills and to follow up next week. Reviewed with our pharmacist who does not feel there will be any strong interactions with her other medications. She should have an INR done next week when she comes in.
3.As she has hearing problems, she is offered resource of coming into our clinic whenever she likes as she has difficulties communicating by telephone.

FAMILY MEDICINE CENTER CLINIC NOTE

BACK AND LEG PAIN
S:The patient symptoms are improved today. Today, she focuses on left upper back pain which she has had since a fall in July of 1996.
O:Thoracic spine films were unremarkable. Lumbosacral films showed a degenerative joint disease with narrowing at L4 through 5. Aortic calcifications were noted as well. BACK EXAMINATION: Reveals tenderness over the mid portion of the thoracic spine paraspinal muscles on the left.
A:1.Chronic low back pain secondary to degenerative joint disease with narrowing at L4-5 with no symptoms to suggest radiculopathy today.
2.Left midthoracic paraspinal muscle tenderness, probably secondary to chronic strain, with no evidence of pathology on lumbar spine films.
P:Advised the patient to consider physical therapy. However, she is reluctant to do this and states that it really has not been a problem for her today. She is instructed to follow up if symptoms change or do not resolve.

DYSPEPSIA
S:The patient now reports that she takes Axid 150 mg tid. Her symptoms are improving. However, she occasionally has some dyspepsia.
O:No examination.
A:Dyspepsia.
P:Reemphasized compliance with 150 mg bid of Axid and prn use of Maalox for interval symptoms. Treatment is four two months with consideration for esophagogastroduodenoscopy if does not respond appropriately as discussed on April 22, 1997 visit. ANTICOAGULATION
S:INR last week 1.9. No change in therapy. Repeat test in one month.

FAMILY MEDICINE CENTER CLINIC NOTE

FOLLOWUP OF BACK AND LEG PAIN
S:See note dated April 7, 1997. The patient lost requisition for x-ray and slip is completed again today, and she will follow up for results in one month. She stated she is impossible to reach by telephone.

DYSPEPSIA
S:Continues on Axid 150 mg, but rather than taking two tablets qhs, she is taking one bid but reports this completely resolved her dyspepsia.
P:Plan is, as before, to continue treatment for two months and then discontinue, it if there are recurrent symptoms, obtain esophagogastroduodenoscopy.

ANTICOAGULATION
S:INR yesterday 3.0 which is therapeutic compared to value on April 4, 1997 of 1.5 though there has been no change in dose and the patient insists that she is compliant.
A:Anticoagulation.
P:Continue same dose. Recheck INR in one month and follow up with me.

FAMILY MEDICINE CENTER CLINIC NOTE

BACK AND LEG PAIN
S:Status post hospitalization ten days ago for rule out deep venous thrombosis with no evidence of deep venous thrombosis. She complains of at least two-month history of mid and lower back pain with radiation to her thigh and below the knee with some numbness over the anterolateral portion of her thigh. There is no history of injury. The patient has been on Coumadin for years and also may have some osteoporosis.
O:Tenderness over the right paraspinal muscles at approximately the level of T12. No midline tenderness otherwise. Straight leg test negative bilaterally. There is decreased sensation over the anterolateral thigh and anterolateral lower leg but no decreased sensation to the foot. However, because of her venous stasis disease, it may be difficult to detect differences between the two sides. Great toe extensors, ankle dorsiflexion and plantar flexion intact. Reflexes 0 to 1+, bilaterally symmetrical.
A:Back pain with possible radicular symptoms.
P:X-ray of thoracic spine and lumbosacral spine to rule out compression fracture or other pathology. Follow up in two weeks for test results.

HEALTH MAINTENANCE
S:Briefly reviewed her health maintenance. The patient is past due for Hemoccults and mammogram which are ordered today. Follow up in two weeks.

DYSPEPSIA
S:Two months ago, the patient was begun on Axid 150 mg bid for recurrent dyspepsia. The patient states that it has worked to some extent. However, she still has some dyspepsia symptoms once or twice weekly. However, on further questioning, it is apparent that she was never fully compliant with recommended treatment.
O:No examination.
A:Dyspepsia. Patient with history of reflux esophagitis first diagnosed in 1982.
P:Axid 150 mg two tablets po qhs to improve compliance. Insist on compliance and follow up at two months. If persistent symptoms at that time, would consider repeating esophagogastroduodenoscopy which, it appears,
has not been done for some time to rule out Barrett esophagus.

ANTICOAGULATION
S:Currently taking 10 mg qd except for Fridays at which time she takes 5 mg qd which is the same dosage as prior to hospitalization.
O:On April 4, INR 1.5.

A:INR subtherapeutic. However, given the fact that the patient was apparently off Coumadin during her hospitalization and was not reloaded, some of the effect of this may still be reflected in the low INR. Plan is to continue same dose and recheck INR in two weeks.

FAMILY MEDICINE CLINIC -- ROOSEVELT

Anticoagulation follow up.

SUBJECTIVE:
The patient stopped by the clinic unscheduled following discharge from the hospital for deep venous thrombosis. Hospital Note not yet available. Per patient report had eye doctor appointment on Friday and then stopped by Dr. D. Eugene Strandness, Jr.'s office, who admitted her to the hospital for deep venous thrombosis. The patient was Heparinized over the weekend, however, Coumadin was not reinitiated. The patient is to take a first dose tonight according to her understanding of instructions.

OBJECTIVE:INR today 1.0.

ASSESSMENT:Subtherapeutic anticoagulation.

PLAN:
Discharge prescription states the patient is to take Warfarin 10 mg qd except 5 mg on Friday which is the same as the patient's pre-hospitalization dose. Tried to call the House Officer for Vascular Surgery to double check that the patient is not to be loaded on Warfarin. Did not return page. I am working with the assumption that this is the intended plan.

FOLLOW-UP:
She will follow up with myself or Allan Ellsworth, PharmD this Friday, 04/04/97, for repeat INR and dosage titration on Warfarin.

Beth Chester, PharmD

ROOSEVELT FAMILY MEDICAL CENTER
CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

ADMISSION DIAGNOSIS:
Rule out deep vein thrombosis.

DISCHARGE DIAGNOSIS:
Rule out deep vein thrombosis.

SURGICAL PROCEDURES PERFORMED DURING THIS HOSPITALIZATION:
None.

HISTORY OF PRESENT ILLNESS:
The patient is a 72-year-old female with a past history of venous stasis and deep vein thromboses to lower extremities who presents with one day duration of right lower extremity pain. The patient states it was acute in onset and hurt constantly. The patient stated that exercise did not make it worse. She also stated that the pain is located in the thigh laterally and posteriorly. The patient stated that she felt as if her right calf was swollen.

PAST MEDICAL HISTORY:
Significant for glaucoma, epilepsy and lower extremity problems already discussed.

PAST SURGICAL HISTORY:
Significant for multiple skin grafts to the lower extremities and hysterectomy.
MEDICATIONS PRIOR TO ADMISSION:
1.Lovastatin.
2.Carbamazepine.
3.Pentoxifylline.
4.Coumadin 10 mg q day, except for Fridays, in which case she takes 5 mg.

ALLERGIES:
NO KNOWN DRUG ALLERGIES.

HABITS:
Denies tobacco, alcohol or drug use.

PHYSICAL EXAMINATION ON ADMISSION:
The patient had palpable bilateral pulses. Multiple split thickness skin graft sites to her lower extremities which are well healed. Compression stockings in place. Positive Homans's sign on the right. Positive calf pain on palpation on the right, but no erythema.

HOSPITAL COURSE:
The patient was admitted for rule out deep vein thrombosis. The patient was started on a heparin drip which was monitored every six hours and the patient's leg was elevated. The patient's hospital course was unremarkable and on the first and second hospital days, the patient's pain began to cease and by the third hospital day, the patient's pain had gone away. Venous duplex examination performed on March 31, 1997 showed right iliac, femoral, popliteal and tibial veins were patent, a chronically occluded left iliac vein, however the rest of her left-sided
veins were all patent, as was the inferior vena cava. Given that the patient's duplex was negative, except for chronic occlusion and the patient's pain had resolved and the patient's lower extremities were no longer edematous, the patient was discharged on her prehospital medications, in addition to Tylenol 650 mg po q 6 hours prn pain.

DISCHARGE MEDICATIONS:
1.Lovastatin 40 mg po qhs.
2.Carbamazepine 200 mg po tid.
3.Pentoxifylline 400 mg po tid.
4.Coumadin 10 mg po q day, except for Fridays, in which case she takes 5 mg.
5.Tylenol 650 mg po q 6 hours prn pain.

FOLLOWUP:
The patient is to follow up with her primary care physician and to return to see Doctor Strandness in the future if she has any further problems.

XDISCHARGE SUMMARY

DYSPEPSIA
S:Patient with history of dyspepsia in the distant past, reports one month history of recurrent dyspepsia, particularly when her stomach is empty. Denies nausea or vomiting. No melena or hematochezia.
O:VITAL SIGNS: Per chart. No epigastric tenderness or right upper quadrant tenderness.
A:Dyspepsia, probably secondary to gastroesophageal reflux disease.
P:Axid 150 mg bid times six weeks. Recheck at two months, earlier if no improvement.

SURGERY CLINIC NOTE

Ms. Hoffman returns to the Vascular Clinic on 2/11/97. Since her last visit she has developed a small punctate area on the dorsum of her right foot which she states will periodically open and then close. This area is quite painful. The lesion itself is approximately 2 mm in diameter but at the present time is well-healed. It is not in the vicinity of any varicose veins so I am not quite sure what this lesion is.

I have no suggestions and told her to return if this does cause her further problems or some other development takes place.

FAMILY MEDICINE CLINIC NOTE

S:The patient is comes into the clinic today complaining of a four-week history of a persistent cough which is productive of yellowish phlegm. Denies any fever or chills or shortness of breath. Complains of chest pain when she is coughing. The patient has a history of multiple medical problems, including a history of recurrent deep venous thrombosis for which she recent anticoagulation. She is followed by Allan Ellsworth. This patient's primary care provider is Dr Neighbor. The patient reports ALLERGY TO PENICILLIN which leads to a rash and ALLERGY TO SULFA which leads to a rash.

O:GENERAL: The patient is alert, in no apparent distress. HEENT: Tympanic membranes clear. Throat is injected. No lymphadenopathy. LUNGS: Clear to auscultation. CARDIOVASCULAR: No jugular venous distention. Regular rate and rhythm. Normal S1, S2.

A/P:Bronchitis. Recommended Suprax 400 mg one po qd for ten days. Follow up with Dr Neighbor in a week if her symptoms are not improved. Of note is that THE PATIENT IS ALLERGIC TO PENICILLIN AT TO SULFA ANTIBIOTICS. She has tolerated Suprax well in the past and has responded well to this antibiotic previously. Of note is that the patient had pneumonia last year. Presently, there is no evidence of this, but the patient made aware that if she develops fevers, shortness of breath, or any concerns to let us know.

ANTICOAGULATION, SEIZURE DISORDER, RECURRENT DEEP VENOUS THROMBOSIS
S:The patient has been taking Coumadin 10 mg each day without complications or problems. No bruising, bleeding. No extension of thromboembolic events.
O:Prothrombin time as INR 3.7.
A:Hypoprothrombinemia.
P:Hold Coumadin tonight. Restart at 10 mg each day with only 5 mg on Friday. Follow up in one month.

CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

UPPER RESPIRATORY INFECTION
S:The patient comes in today continuing to complain of cough productive of purulent sputum as well as purulent rhinorrhea. She is finishing a ten-day course of doxycycline that was started on October 21, 1996, with minimal improvement. She has not had any fevers or chest pain.
O:Temperature is 36.7, respirations 24, pulse 18, blood pressure 130/70, weight is 152, and oxygen saturation is 96% on room air. GENERAL: A hard-of-hearing but well appearing woman with a productive cough. PHYSICAL EXAMINATION: HEENT: Tympanic membranes are unchanged from my last examination with serous otitis bilaterally. Nares are mildly erythematous with purulent drainage. Oropharynx is normal with new drainage. NECK: Supple with normal lymphadenopathy. HEART: Regular rate and rhythm without murmurs. LUNGS: Without persistent crackles in the bases.
A:Question persistent bronchitis versus persistent sinusitis.
P:1.Ceftriaxone 1 gm IM followed by Suprax 400 mg one po q day for fourteen days. Follow up in fourteen days.
2.If symptoms have not improved, will get a limited sinus CT scan to be sure that we are following the correct thing. If the patient continues to have difficulty after this, would recommend followup with ENT Clinic.

SEIZURE
S:The patient had finished in clinic, gone down to pharmacy to fill her prescription, and came back to ask a question about her medication. Helped with someone by the front desk staff and found the patient complaining of severe headache and not mentating clearly. She was saying that she was fine and wanted to go home, but her speech was somewhat slurred and she was not answering questions appropriately. While myself, Elizabeth Gamboa, and Beth Chester were talking with her, she had three or four movements of her right arm, fluttering of her eyelids, and stiffening of her entire body with attempts to stand up. She continued to talk during most of the episodes that lasted approximately 40 seconds.
She did have some breaks in her speech and continued to say that she was fine and that she was going to fight this and wanted to go home. After approximately 40 seconds, she agreed to sit down, and her thoughts became more coherent. She knew where she was, that she had had a seizure, and she had been somewhat belligerent during it.

O:Bringing her back to an examination room to draw a Tegretol level, she was quite ataxic but able to ambulate with assistance. Approximately 30 minutes after her seizure, a neurological examination found her alert and oriented with cranial nerves II through XII individually tested and intact. Motor strength was 5/5. Flexors and extensors in upper extremities and lower extremities, deep tendon reflexes were 2+ at the elbow, right knee, and bilateral ankles. Left knee had no knee jerk. Toes were downgoing bilaterally. Sensation was grossly intact. Cerebellar examination revealed normal

single finger-to-nose, normal heel-to-shin, positive Romberg, and ataxia with heel-to-toe walking. The patient states that she always has poor balance. On the mental status, the patient was oriented times three, was able to subtract 3 from 20 down to 11, was able to remember two out of three objects after five minutes and seemed to be back to her normal self. Tegretol level was 7.4 which is the low end of therapeutic but is normal for her.

A:Likely petit mal seizure. Questions of pseudoseizure.

P:Continue Tegretol at current dose. Plan to follow up in two weeks. If this continues to be an escalating pattern, would consider additional seizure medication or touching base with her neurologist.

S:The patient returns to the clinic to discuss lab results from yesterday. Yesterday, she came in reporting an episode of bright red blood per rectum. Hematocrit and INR tests were ordered. Today, the patient is feeling much better, denies any more episodes of blood in the stools.
O:GENERAL: The patient is alert, in no apparent distress. INR is 2.0. Prothrombin time 23.7. Hematocrit 41%.
A/P:1.Status post gastrointestinal bleed, hematocrit stable. INR is 2.0.
2.History of recurrent deep venous thromboses. The patient currently on Coumadin, followed by Allan Ellsworth, pharmacist for this. Advised to continue with previous recommendations on her Coumadin.
3.The patient has an appointment to see Dr. Neighbor next week. Dr. Neighbor is her primary care provider.

FAMILY MEDICAL CENTER

CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

S:This is a patient of Dr. Neighbor who comes to the clinic today complaining of an episode of bright red blood per rectum yesterday evening and this morning again. She has never had this type of problem before. She does report a history of hemorrhoids for many years, although this had never caused her rectal bleeding in the past. She is also complaining today of a four week history of a cough and nasal congestion and sinus pressure. She is found to be ALLERGIC TO PENICILLIN AND SULFA DRUGS. She denies any chest pain. She reports that about two days ago she had a low-grade fever and none today.
O:GENERAL: The patient is alert and in no apparent distress. VITAL SIGNS: Blood pressure is 100/70. Heart rate is 76. Respiratory rate is 16. Weight is 154 and stable. Temperature is 36.5. HEENT: TMs are clear. Throat is injected. NECK: Supple. No lymphadenopathy. LUNGS: Clear to auscultation. CARDIOVASCULAR: No jugular venous distention. Regular rate and rhythm, normal S1 and S2. ABDOMEN: Positive bowel sounds. Soft, nontender. RECTAL: Stool is heme positive. Anoscopy shows evidence of external hemorrhoids with a small amount of bright blood around these.
A/P:1.Acute bronchitis, recommended doxycycline 100 mg one po bid for ten days. Followup with Dr. Neighbor in one week.
2.History of GI bleeding, may be related to her external hemorrhoids, but I cannot be sure of that. She may require a flexible sigmoidoscopy if the problem is recurrent. The patient is advised to follow a high-fiber diet and if she develops a recurrent episode of bright red blood per rectum, would like her to call the clinic immediately. We will go ahead and check a hematocrit today. Discussed with the patient that we need to observe her closely.

PROBLEM: Serous otitis media.
S.The patient is a 71-year-old woman who presents today complaining of increased hearing loss. In general, she does have hearing loss and wears one hearing-aid. She has not been wearing this hearing-aid recently and feels that her hearing is worse. She has recently been on antibiotics including Doxycycline and Keflex for possible pneumonia. She has also been using Afrin nose spray for eustachian tube dysfunction. She denies any pain in her ears. She still has some cough and rhinorrhea, both productive of yellow sputum.

O.VITAL SIGNS: Temperature 36.9. Pulse 84. Blood pressure 124/66. Weight is 155. GENERAL APPEARANCE: The patient is a well-appearing, but very hard of hearing, woman in no acute distress. HEENT: Normocephalic, atraumatic. Right tympanic membrane with yellowish fluid behind the eardrum with normal light reflex and minimal movement of the drum. Left tympanic membrane has normal light reflex but some fluid behind the drum with no movement. Oropharynx is slightly erythematous but no tonsillar enlargement or purulent drainage. Tympanograms bilaterally were completely flat. NECK: Supple with no lymphadenopathy. CARDIAC: Regular rate and rhythm. LUNGS: Crackles in bilateral bases.

A.1.Serous otitis possibly secondary to eustachian tube dysfunction and recent upper respiratory tract infection.
2.Persistent crackles in bilateral lung bases.

P.1.Encouraged the patient to wear her hearing-aid as this may improve her hearing loss.
2.Asked the patient to return in three weeks to evaluate clearing of the fluid at that time. If there is no improvement, would consider referral to Otolaryngology for further evaluation in light of her previous hearing loss.

FOLLOWUP OF PNEUMONIA AND EUSTACHIAN TUBE DYSFUNCTION
S:Completed ten-day course of doxycycline and five-day course of Afrin nasal spray for eustachian tube dysfunction without problems. Feels considerably improved. While she continues to have some feeling of hoarseness in her breathing, she denies fevers, chills, night sweats, or any productive cough.
O:VITAL SIGNS: Per chart. Afebrile today. HEENT EXAMINATION: Reveals tympanic membranes move bilaterally equal and are clear. CHEST: Clear today throughout, without rales or wheezes.
A:1.Pneumonia, resolved, with treatment with doxycycline.
2.Eustachian tube dysfunction, clinically resolving.
P:Follow up prn for this problem. Otherwise, continue regular followup for her prothrombin time and monitoring for Tegretol.

URI (POSSIBLE PNEUMONIA)
S:The patient continues to have a slight cough. She complains of blocking of her ears over the last several days. She is still taking Doxycycline bid, as prescribed by Dr. Neighbor (progress note not yet in the chart). She does not have a fever and feels well.

O:VITAL SIGNS: WT 161 lb. BP 132/80. TEMP 36.1 orally. NECK: No cervical adenopathy. THROAT: Clear. No PND detected. NOSE: Not particularly congested. LUNGS: There are rales heard in the mid-axillary area that do not clear with coughing. A chest x-ray was performed, which showed no evidence of any infiltrates (I wonder whether the rales are an old finding since the location is not usually included in a routine examination). EARS: TMS appear normal.

A:The patient most likely has a URI which is now resolving, and also eustachian tube dysfunction as a result of the illness.
P:1.Afrin nose drops bid x 5 days and no more.
2.Return to see Dr. Neighbor next week for her routine followup.

ROOSEVELT FAMILY MEDICAL CENTER
CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET

SEATTLE, WASHINGTON 98195

FAMILY MEDICINE CLINIC NOTE

PROBLEM #1. Left lower lobe pneumonia.

SUBJECTIVE:
See prior note. Completed ten-day course of Keflex with some improvement in cough but still intermittent production of yellowish sputum, without fever, chills or night sweats, complains of some left chest wall discomfort.

OBJECTIVE:
VITAL SIGNS: Weight 159, stable. BP 114/56. Temperature afebrile. GENERAL: No acute distress. HEENT: Unremarkable. CHEST: Left base rales, otherwise clear, no wheezes.

ASSESSMENT:
Left lower lobe pneumonitis, community acquired, with poor response to Keflex. Suspect Mycoplasma.

PLAN:
Given that erythromycin would interact with her Tegretol and Coumadin, will treat with doxycycline 100 mg bid times ten full days with GI precautions. Follow up in two weeks for pneumonitis. If persistent symptoms at that time, would place PPD and obtain chest x-ray. Will also check PT at that time.

ADDENDUM:
On 9/3 her INR was 1.8, but prior to that, on 8/8, it had been 3.0. There was no change in dose. Her Tegretol level on 9/3 was 7.9. Her sleep-deprived EEG revealed bitemporal eliptiform discharges. The patient refused VN visit to her home.

PERSISTENT COUGH

S:Patient presents to the clinic with a two week history of cough unrelieved by Robitussin. Patient states that she has taken five bottles over the last two weeks. Her cough is slightly productive of phlegm which is gray-green in color. She is unable to loosen larger amounts of phlegm, which she states she can feel in her chest. She has no complaints of nausea, vomiting, chills or fever. She has had no sore throat or runny nose.

O:VITAL SIGNS: Patient is afebrile. HEENT: Exam unremarkable. CHEST: Left lower lobe rales appreciated.

A:MILD LEFT LOWER LOBE PNEUMONIA.

P:Given patient prescription for Robitussin AC for cough. Rx with Cephalexin 250 mg one capsule bid x 10 days. Patient is to bring in her own supply to pharmacy to verify dose and adequate quantity for ten full days of therapy. Patient will followup with Dr. Neighbor in two weeks and call prn problems.

ROOSEVELT FAMILY MEDICAL CENTER

CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

S:The patient is a 71-year-old divorced woman referred by Ann Hawn, MD and also a patient of William Neighbor, MD. She is referred for a general psychiatric disorder. On July 11, she had a "seizure" where she, while in the Ophthalmology Clinic where she was gently lowered to the floor after feeling "faint" or "limp." She was observed to have a random arm and head movements and was thought to have a seizure. She was evaluated in the Emergency Room and these subsequently by Neurology. The neurology consult questioned the authenticity of the seizures, and then she had a followup EEG which was judged to be abnormal but inconclusive. She has a history of "seizure disorder" going back to her earliest notes in the Family Medical Center chart in 1983. A review of the chart suggests that the authenticity of the seizures has been questioned for over ten years with the majority of the symptoms appearing to be consisted with pseudoseizures. Despite this, she is currently on anticonvulsants.

She was given psychological testing in 1985 and was found to have a full scale IQ of 72. She has broad severe cognitive impairment in most levels of her functioning which are consistent with longstanding organic brain damage. She is noted in that evaluation to be functioning at a much higher level socially due to her ability to rely on other individuals.

She arrived 30 minutes late for her evaluation today and immediately began complaining about her cough and low back pain, expressing some skepticism about why she needed to be evaluated. She was very difficult to engage in the interview and had a loose, disorganized cognitive style that was difficult to follow. She endorsed essentially no psychiatric symptoms except middle insomnia. She was questioned about a full range of depression, mania, psychosis, and anxiety symptoms. She gave very little prior history, and "I don't know" was a common response. She does not know of any past or family history of psychiatric disorder
and noted only that her father had a lifelong grand mal seizure disorder which was treated with phenobarbital. She has no history of any alcohol or drug use.

She currently lives with her son in an apartment in Northeast Seattle. She has another son who is married. She has not worked very much through her life except in childcare settings. She grew up in Bainbridge Island to a family that she said was "fine." She is the middle of three children and described her brother and sister who did well. Her mother was "strict and orderly." Her father was "a groundskeeper." She was not able to describe any emotional characteristics of either of her parents. She denied any history of emotional, physical, or sexual abuse or neglect and reported no domestic violence as an adult. She states she was educated through high school but got the "lowest grades ever." She was married at age 20 and lived with her husband for 25 years, after which he left her for another woman.

O:Mental status examination was notable for a casually dressed and groomed woman who appeared

very disorganized and had trouble following the interview. Part of this was due to a hearing impairment, but even when she clearly heard my questions, the answers were occasionally off target and reflected her desire to talk about what she thought was important. She spoke without any latency. Her thought process was nonlinear, often circumstantial and tangential. She had no abnormal content, including suicidality, or any cognitive distortions. She was oriented times three but was unable to do the simplest abstractions such as similarities between an apple and an orange, proverbs, or dissimilarities. She could count backwards from ten but could not do so from 100. She could not do the month of the year backwards. Her mood was neutral, affect full range. Judgment and insight were extremely poor.

A:In summary, this 71-year-old woman provided very little new information during the interview. She seems
very consistent with the prior descriptions of her problems in the chart, particularly a 1985 neuropsychological assessment which suggests that she has longstanding cognitive impairment that shows a broad and severe pattern. She most likely has organic brain damage from some birth trauma, and she is nonetheless able to present herself as someone who does not appear to be as severely impaired as she actually is. She has been able to live in the community with the assistance of other family members and has basically overlearned and rehearsed certain social graces that allow her to just get by. I am grateful that she has had a recent neurology workup and that, according to the chart, she has also had, in 1993, an MRI and before that, in 1990, a CT. These organic workups suggest that the majority of what she expresses is probably a pseudoseizure, although one cannot rule out an underlying organic seizure disorder which would be consistent with the organic damage that she has experienced. The relative proportion of these is unknown, but my guess would be that most of what we are seeing is a well controlled seizure disorder that has erupted periodically as a pseudoseizure process. The triggers of these spells are not clear. However, in most patients, they have to do with episodic social stressors. She did mention that insecurity about housing was one thing that brought these on in the past.

P:I would suggest that you continue with your supportive care of this woman for her primary care medical problems. She is an easily overwhelmed woman who would likely decompensate in the presence of a new social stress or the absence of the family who has provided so much supportive care. It might be interesting to invited her son, who lives with her, as well as her married son, to talk about ways in which they can prepare her to continue to live through her remaining years. Since she expresses no symptomatic distress at this time, I have no recommendations for pharmacologic management other than the maintenance of her anticonvulsant. Return to see Dr. Neighbor prn.

SEIZURE DISORDER
S:Sleep deprived EEG was done earlier this week, but final report is not yet available. She has had no recurrent seizure activity and has been compliant with Tegretol 200 mg qid. Tegretol and prothrombin time done today for her seizure disorder and her Coumadin treatment. She is to follow up next week for test results, and she is very difficult to reach by telephone.

COUGH
S:Since last week, has had a hacking nonproductive cough, occasionally productive of yellowish sputum, without fever, chills, or night sweats.
O:Afebrile, no acute distress. HEENT: Examination unremarkable. CHEST: Clear throughout.
A:Viral upper respiratory infection.
P:She may safely use dextromethorphan type over-the-counter cough remedies. Follow up if recurrent problem.

SEATTLE, WASHINGTON 98195

SEIZURE DISORDER
S:See prior note. The patient has sleep EEG which was slightly abnormal, and recommendation was for sleep deprived EEG. Current Tegretol dose is 200 mg qid which is increased from tid, her previous dose. She has had no recurrent seizures and no side effects from the increased dose of Tegretol.
O:Weight 160, blood pressure 140/80, pulse 76 and regular. No other examination today.
A:Seizure disorder, etiology to be determined, presently well controlled.
P:1.Scheduled sleep deprived EEG.
2.Return in one week for Tegretol level which would occur about ten days after a change in dose. She would have a Coumadin measured at that time as well.
3.I will call VNS to arrange for home safety evaluation and the possible use of lifeline at home. Their number is 1-800-449-2221.

PHLEBITIS
S:Developed some redness on the inner aspect of her right arm shortly after her hospitalization and IVs. This has been improved. She has been using cold packs but not warm moist packs on the area.
O:Afebrile. Examination reveals slightly red, slightly increased warmth area over the inner aspect of her right ARM. There is no venous engorgement distally and no streaks running up the inner aspect of her arm.
A:Mild post catheter phlebitis.
P:Warm moist packs bid and expect continued improvement. Otherwise, recheck.

PROBLEMS
1.Followup of seizure.
2.Followup of chest wall contusion.

S:A 71-year-old female with a history of seizure disorder, recurrent phlebitis and deep venous thrombosis, on Coumadin and multiple other problems. On July 11, she was seen in the Emergency Room for seizure or possible pseudoseizure. She was scheduled for an appointment with neurology. She was seen there on approximately July 18. An EEG was done which was abnormal. It was recommended that possible sleep deprivation EEG would be helpful. It was recommended that she increase her Tegretol from 200 mg tid to 200 mg qid. However, she misunderstood the instructions and increased her Tegretol to 400 mg qid. She took at least three doses the next day and two to three doses a day following. On that day, July 20, she was feeling really funny, got up to walk across the room, felt even more weak, with whole lower body weakness and she ended up falling and hit her back on a bookcase. She was seen in the Emergency Room at that time, and her Tegretol level was noted to be now 15.1. It had been 6.4 on her visit of July 11.

It was also noted that her prothrombin time had increased from 13.6 on July 11 to 28. She was sent home from the emergency room off of the Coumadin, which she takes 10 mg qd, and the Tegretol. She was to follow up on July 23 at the clinic here. However, she said "one more day would not matter. I am feeling fine" and came in today. She has been feeling fine at home. No seizure activity at home.

O:No acute distress. VITAL SIGNS: Blood pressure 124/80, pulse 76. A 13.5 x 5 cm ecchymotic area over the posterolateral left chest. Tenderness over the bruise, but ribs are nontender. HEART: Regular rate and rhythm without murmurs. LUNGS: Clear. NEUROLOGIC: Cranial nerves III through XII grossly intact. Has 2+/2+ deep tendon reflexes in the upper extremities, 1+/2+ in the lower extremities. Good muscle strength and tone in the upper and lower extremities. Romberg positive
with eyes open. Not attempted with eyes closed. The patient did not want to do it. Slight ataxia. Unable to do heel-to-toe walking.

A:1.Chest wall contusion.
2.Follow up of seizure with secondary Tegretol toxicity.

P:1.Continue with ice in the area of her bruising.
2.Neurologic exam is essentially unchanged from the neurology note of July 18. Case discussed with Dr. Church and Dr. Ellsworth. Decided not to load her back with the Tegretol and Coumadin since she was high four days ago. Will start back on the Tegretol 200 mg qid. She will take a qid dose

today. Go back on the Coumadin 10 mg qd. Continue with her Trental and lovastatin which have been unchanged. Follow up in one week with Dr. Neighbor to see how she is doing and then in two weeks with Dr. Neighbor, her primary care physician, for a repeat Tegretol level.
3.Electrolytes, prothrombin time, Tegretol level, and liver function tests drawn today.

NOTE: After the patient had left the examination room and after she had made her followup appointment, she had an apparent seizure in the waiting room. Please see handwritten note on the chart. She was transferred to the Emergency Room.

ANTICOAGULATION

S:The patient reports to clinic unexpectedly to discuss results of prothrombin time INR. The patient takes warfarin 10 mg daily except for Tuesdays and Saturdays when she takes 7.5 mg. The patient adamantly denies any missed doses, dietary changes, or changes in prescription or over-the-counter medications. No signs or symptoms of thrombolic events and no complaints of any unusual bruising or bleeding.

O:INR 1.1 on July 11, 1996, upon presentation to the Emergency Room (see previous note.)

A:Inadequate anticoagulation without complications, unable to reconcile sub-therapeutic INR with the patient's history.

P:Continue daily warfarin. The patient to take 15 mg tonight only followed by 10 mg daily thereafter. Follow up with repeat prothrombin time INR in two weeks.

7/12/96

RIGHT ARM PAIN

S:Jeanne is a 71-YO female who was seen in the ER yesterday for evaluation of seizure. She was in the Eye Clinic, when she went "faint/limp" and was guided to the floor, and she started with random arm and head movements. At that time, she was thought to have a seizure. The code team was called, and she was brought down to the ER. Her vitals remained stable at all times. She was treated in the ER with a total of 7.5 mg of Valium and 1 gm of Dilantin. Her "seizures" resolved after several hrs in the ER. Neurology was consulted. The neurology consult questioned that she was indeed having seizures because they said that the movements were not typical of seizures, and rather they thought that perhaps she was having pseudoseizures. Her seizures are not well-documented in her hospital chart. It was decided at that time that she would F/U with an EEG on Wednesday, July 17, at 1:00 p.m., and from there, F/U with Neurology for further evaluation. She was discharged to home.

Jeanne comes in today, with no memory of what happened yesterday, and with the complaint that her right forearm hurts. Otherwise, she is feeling better and has no complaints.

O:Pleasant female in NAD. Much more alert and oriented than when seen in the ER. Very steady on her feet. BP 132/80, pulse 78, wt #152. RIGHT FOREARM: With some swelling, as compared to the left; mild tenderness to palpation of the right forearm and in the right antecubital area; some evidence of bruising in the antecubital region; no evidence of skin breakdown; minimal erythema; no warmth, as compared to the left arm; strength intact; reflexes 1+ bilaterally.
A:Phlebitis. OF NOTE: While in the ER, Jeanne had an IV in her right forearm, and it was bandaged on a straight board so it would not come out while she was having her seizure-like movements. The IV and tape wrapping are the most likely etiologies of her phlebitis, bruising, and right forearm pain. Discussed this with Jeanne.
P:1.She
will take Motrin 600 mg q.4-6h. with food p.r.n.
2.She will use ice tonight; then, she will treat with heat.
3.She is also to keep the forearm elevated.
4.She will call if any of her symptoms worsen.
5.I re-emphasized today the importance of following up with her EEG and Neurology.
6.Pt is also going to F/U with Al Ellsworth regarding her Coumadin management.

ORTHOPEDICS CLINIC NOTE

HISTORY OF PRESENT ILLNESS:
Ms Hoffman returns now almost four months after her right thumb distal phalangeal interarticular fracture. Today she has reasonable range of motion of the IP joint. She is able to touch the base of her fifth finger. She has minimal pain, and would like nothing more done. This certainly seems reasonable.

ON EXAMINATION:
Today her pinch strength is 12 pounds bilaterally. In apposition mode, grip strength is 35 pounds on the right, 45 pounds on the left.

PLAN:
We gave her are card should she develop post-traumatic arthritis in this joint painful enough for her to want an IP joint fusion. Her followup is then left on a prn basis, and she understands. She was seen with Doctor Trumble today.

SEATTLE, WASHINGTON 98195

ORTHOPEDIC HAND CLINIC NOTE:

DIAGNOSIS:
Status post right thumb intra-articular fracture on 2/1/96.

The patient presents to Orthopedic Clinic today complaining of a rash over the dorsal aspect of the proximal phalanx of the right thumb. She states that this rash is secondary to Gel pad use. She had discontinued the use of the Gel pad over a week ago, and she states that the rash persists.

On physical examination there is a very mildly erythematous area of skin over the dorsal aspect of her right proximal phalanx. There is no skin breakdown.

RADIOGRAPHS: None.

ASSESSMENT:
This patient is now three and one-half months status post right thumb intra-articular fracture. She has developed a rash over the dorsum of her right thumb IP joint from Gel pad use. We have recommended Benadryl on a prn basis, 1% hydrocortisone cream on a prn basis and for the patient to return to our clinic in two weeks' time for a follow up examination.

BONE & JOINT CENTER CLINIC NOTE

SUBJECTIVE:
The patient returns to clinic today for followup status post right thumb intra-articular fracture on 02/01/96. The patient was treated with a splint initially and later with a Stax splint for protection. Three weeks ago she began rehabilitation. She complains of continued pain and burning in the IP joint of the right thumb. She and Dr. Vedder discussed the possibility of an IP fusion in the event that her symptoms continue at an unacceptable level.

OBJECTIVE:
On examination today, the patient continues to have swelling of the thumb with tenderness to palpation particularly dorsally over the IP joint. The stinging pain them radiates proximally to the MP joint. No x-rays were taken but review of x-rays taken three weeks ago shows an intra-articular dislocated right thumb fracture. Her range of motion continues to be minimal. She has from 0-30 of IP flexion on the right which compares to 0-55 on the left.

ASSESSMENT:
The patient continues to have pain and swelling following her intra-articular fracture. This is superimposed on a long history of degenerative joint disease affecting the joint. Again we discussed the possibility of needing to fuse the joint; however, we are going to move cautiously. The patient has had some peripheral vascular disease, which has required skin grafts to non-healing ulcers on her legs. She is also on coumadin at 10 and 10 qd. If she goes over on 10 and 10 she goes to 10 and 7.5.

PLAN:
For now the plan will be to place a Gel pad over the swollen area of her thumb to see if we can help to shrink the swelling and decrease the inflammation. We will check her back in a month for followup x-rays. The patient was examined today by Dr. Trumble.

BONE & JOINT CLINIC NOTE

SUBJECTIVE:
Ms. Hoffman returns 2-1/2 months status post right thumb intra-articular fracture. She has been wearing a stack splint. She continues to have some stiffness and tenderness with movement of the joint. She does have a history of significant osteoarthritis in both hands, evident on the x-rays.

EXAMINATION:
On examination, she still has some tenderness over the fracture and surrounding tissues. She has about 20 of motion at the IP joint. The swelling is minimal. Today's x-ray shows evidence of good healing with previously apparent numerous osteophytes, both at this joint and other joints of the fingers. She has some dorsal angulation and intra-articular displacement at the IP joint.

PLAN:
The plan is to have her do some home exercises with some soft yellow putty to increase her strength and range of motion. She will continue to wear her stack splint when she is lifting heavy objects or seeks extra protection.

Doctor Trumble saw this patient and she appears to understand the instructions.

ROOSEVELT FAMILY MEDICAL CENTER
CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

ORTHOPEDIC CLINIC NOTE:

Ms. Hoffman is a patient of Dr. Sullivan's in the Family Medicine Center at Roosevelt, as well as a patient of Dr. Strandness. She presents having sustained an intraarticular fracture at the base of her right thumb distal phalanx three weeks ago. She has been splinted since that time. Radiographs show that she did have what appears to be a proximal base of distal phalanx thumb with an intraarticular extension. Superimposed on this are significant changes associated with osteoarthritis with osteophytes and lipping, as well as joint narrowing.

On examination, she still has some tenderness over the fracture and has about 20 of motion at the IP joint. There is not too much swelling associated with this, however.

At this point in time there is not much we can do other than allow this to continue to heal in its current position even though it does have some dorsal angulation and intraarticular displacement. We discussed with her the long range course of this and the significant change she has of developing worsening arthritis of the IP joint, especially given her history of superimposed osteoarthritis. We also discussed the possibility that she may ultimately need to have this joint fused, however, she is not interested in considering this at this point in time. We will therefore get her fitted for some new splints for this and allow the bone to fully heal before making any recommendations about further interventions. We will see her back in three to four weeks.

ADMISSION DIAGNOSIS:
Venous stasis ulcer on the right ankle.

DISCHARGE DIAGNOSIS:
Venous stasis ulcer on the right ankle.

OTHER DIAGNOSES:
History of recurrent deep vein thromboses, history of seizures.

SURGICAL PROCEDURES PERFORMED:
Split thickness skin grafting of the right ankle, January 4, 1996.

HISTORY OF PRESENT ILLNESS:
The patient is a 70-year-old female who has had a history of recurrent deep vein thromboses and hypercoagulable state, who has had significant venous stasis ulcer on the right ankle. The patient has had a long history of ulcers, and had skin grafting several years ago. The patient initially was admitted earlier between November 28, 1995 and December 5, 1995 to treat the venous stasis ulcer, but now returns with poor healing of the current ulcer despite Unna boot and antibiotics.

PAST MEDICAL HISTORY:
History of recurrent deep vein thromboses, history of seizures, venous stasis disease as above, history of reflux esophagitis, history of hyperlipidemia.

CURRENT MEDICATIONS:
1.Tegretol 200 mg po t.i.d.
2.Pentoxifylline 400 mg po t.i.d.
3.Lovastatin 20 mg po b.i.d.
4.Coumadin 10 mg po qPM.

ALLERGIES:
The patient has no known drug allergies.

PHYSICAL EXAMINATION ON ADMISSION:
The patient is an elderly female who appears well-nourished and well-developed. Cardiovascular: Regular rate and rhythm, no murmurs. Lungs: Clear to auscultation bilaterally. Abdomen: Soft. Neurologic examination: Intact and symmetric with normal sensation to both lower extremities and toes. Right leg has a approximately 7 cm ulcer above the medial malleolus with some fibrinous exudate and greenish discharge and a central dime-sized ulcer.

HOSPITAL COURSE:
The patient was admitted to the Vascular Surgery Service on December 22, 1995 for wound care and antibiotics. We attempted to allow the wound to heal on its own with leg elevation, bed rest and intravenous antibiotics and wet-to-dry dressings. We also initiated whirlpool treatment with Physical Therapy. However, despite these measures, the central unhealing ulcer area did not heal and it was decided that a skin graft would be necessary. The patient underwent split thickness skin grafting on January 4, 1996 without any complications. Postoperatively the patient was kept under a dressing for five days, after which the graft appeared to take 100%. The donor site was treated with a Xeroform gauze and allowed to dry. The patient appears to have taken the graft quite well and is discharged on postoperative day #7 in stable condition. The staples were removed today and the wound was dressed with a nonadhesive gauze and Unna boot was placed with an ACE wrap around that. The patient is instructed to keep the leg elevated as much as possible and to followup with Doctor Strandness on Friday, January 19, 1996.

DISCHARGE MEDICATIONS:
1.Coumadin 10 mg po qPM.
2.??Pentoxacillin?? 400 mg po t.i.d.
3.Tegretol 200 mg po t.i.d.
4.Lovastatin 20 mg po b.i.d.
5.Omeprazole 20 mg po qd.
6.Percocet, 1-2 po q 4 hours p.r.n. pain.
7.Colace 100 mg po b.i.d.

PREOPERATIVE DIAGNOSIS:
Non-healing right medial ankle ulcer.

POSTOPERATIVE DIAGNOSIS:
Non-healing right medial ankle ulcer.

OPERATION:
Excision, chronic ankle ulcer, with split thickness skin graft using right lateral thigh as donor.

SURGEONS:
D. Eugene Strandness, Jr., MD
Julie Wynne, MD
George Huang, MD

ANESTHESIA:
General.

INDICATIONS:
Ms. Hoffman is a 70-year-old woman with a history of chronic leg ulcers. She has had skin grafting to similar ulcers in the past, and now presents with a non-healing ulcer on the medial malleolar aspect of the right ankle.

METHOD:
Informed consent was obtained. The patient was brought into the Operating Room and placed in the supine position. When adequate general anesthesia had been obtained, the patient was prepped and draped in sterile fashion.

At that point, a #10 blade was used to remove the non-healing ulcer tissue down to bleeding tissue. The fragments were sent to Pathology for examination. When an adequate skin graft bed had been prepared on the ankle, a dressing of epinephrine and saline was placed on the ankle.

Attention was then turned to the right lateral thigh. A split thickness graft of 0.015" thickness and measuring 30 cm2 was taken from the right superior lateral thigh. The skin graft was then meshed in a 1:1.5 fashion. The ulcer site was then reinspected and good hemostasis was noted. The skin graft was then laid in place and fastened with staples around the circumference.

Wet fluffs were then placed in the middle of the graft to keep it adherent to the grafting site. A Kerlix was then used to cover the fluffs and a Coban dressing was then placed around the operative site, as well as the foot and ankle.

The donor site was then examined and found to be hemostatic. A piece of fine mesh gauze was then placed over it and it was then covered with a sterile gauze dressing and paper tape.

The patient tolerated the procedure well. Estimated blood loss was 10 cc. IV fluids: 400 cc of lactated
Ringer's.

SPECIMENS:
Wound fragments to Pathology.

DRAINS:
None.

COMPLICATIONS:
None.

DISPOSITION:
To the Recovery Room in satisfactory condition.

12/12/95
PROBLEM: Anticoagulation.

S:Phone call to follow up patient-generated laboratory. Apparently she was in the hospital last week for a leg ulcer and had some difficulties with her Coumadin, with very high and very low numbers, and some dosage manipulations. Since last Tuesday she has been on 10 mg a day. Follow up prothrombin time on the following Friday (12/8).

O:Prothrombin time on 12/8, 2.3.

A:Anticoagulation, probably not yet stable nor steady stated.

P:Continue 10 mg of Coumadin each day, recheck prothrombin time next Wednesday. Concomitant with visit with Dr. Neighbor.

DIAGNOSIS
Venous stasis ulcer.

OPERATIONS/PROCEDURES
None.

HISTORY OF PRESENT ILLNESS
This is a 70-year-old white female with a history of recurrent right lower extremity venous stasis ulcers and a hypercoagulable state who has had significant progression of an ulcer with home care over the last several weeks. She denies fever, chills, nausea, or vomiting. She has noted increased pain and increased discharge over the last several days.

PAST MEDICAL HISTORY Includes:
1.Venous stasis disease.
2.Recurrent deep venous thromboses (on Coumadin)
3.Seizures (on Tegretol).
4.Reflux esophagitis.
5.Cholesterol.
6.Positive PPD
7.Vertigo.

PHYSICAL EXAMINATION
Lungs clear to auscultation. Abdomen soft, nontender, nondistended. Positive bowel sounds. Extremities: On the medial aspect of her right ankle, there is a 5 x 4 cm ulcer with a central cavity. The periphery shows good granulation tissue.

HOSPITAL COURSE
The patient was admitted to the hospital for wound care which included whirlpool and Water Pic therapy. Over the course of her therapy, the outer margins of her ulcer began to heal well. She was discharged to home on 12/05/95 with a small 1.7 x 1.2 cm ulcer. She has instructions to continue her wet-to-dry dressing changes b.i.d. She will continue to be followed in the anticoagulation clinic, and she is to follow up with Dr. Strandness on 12/08/95. Of note, she was also started on omeprazole for her esophageal reflux, and her discharge medications now include Coumadin 5 mg tablets two tablets p.o. q.h.s. and omeprazole 20 mg p.o. q.day.

RE:HOFFMAN, JEANNE
U 8-17-01-35

Dear Mrs. Hoffman:

I tried to call this evening to relay the results of your prothrombin time from Friday. Sorry I missed you. I presume you are still taking 10 mg each day except for Thursday when you take 12.5 mg and you are not having any difficulties with bruising or bleeding. If either of the above two conditions are incorrect, please notify me at your earliest convenience. If they are correct, please continue taking the same dose as your prothrombin time was nearly within therapeutic range at 1.8. As you know, we are shooting for a goal of prothrombin time as INR between 2.0 and 3.0. We should plan on rechecking the prothrombin time in 1 month. Please let me know slightly in advance, and I will help facilitate getting this done. If you have any other questions or problems, please don't hesitate to contact me.

Sincerely,

Allan Ellsworth, PharmD

S:This lady came in today for removal of sutures that were put two weeks ago on a cut in her head. The area is completely cleaned and there is good connection between the two sides of the cut. I took the sutures out at this time. As there is no need for any other treatment, she will be able to wash her hair tomorrow.

A second problem, she has had conjunctivitis over the last four or five days with some secretion and pus-like in the morning and later on, not a big amount. Also some mild photophobia, no pain in the area, no sensitivity when I checked it. She had a history of glaucoma with cataract operation on the right side. This looked mainly as a viral conjunctivitis. She was given gentamicin ophthalmic rub only as a cover to prevent secondary infection or recurrent infection. It this does not improve or if she has any pain, she will come to the clinic.

S:C/o 1 wk h/o URI. She is now blowing thick yellow mucus and coughing up the same kind of sputum. Her teeth hurt. She has had facial pain and increased pain to her face with flexion. She has taken sinus tabs w/o any relief of her symptoms. She is on Keflex 250 mg q.i.d. prescribed by Dr. Strandness for an infected leg ulcer. She has been at this dose for, I believe 10 days, and has f/u appt with Dr. Strandness on Friday June 30.

O:77 YO female in mild distress. Eyes are watery. Ears clear. Normal TMs. Nasal mucosa red and moderately edematous. No purulent mucus noted. Throat: Mild posterior pharynx erythema and purulent postnasal drainage. No cervical adenopathy. NECK supple. CHEST clear to A. There is exquisite tenderness to the right frontal and maxillary sinuses, and moderate tenderness on the left.

A:Acute sinusitis.

P: Discussed with Tammy Marek who knows this pt well and has followed her with her medications. Keflex is obviously not giving any benefit toward the sinus infection, and will change to Suprax 400 mg, #14, 1 qd.

Tammy will follow the pt next wk at her regularly scheduled time, and will arrange for f/u appt with me if that is necessary.

Pt is to continue to use warm packs to the face and steam might be helpful for her. She is to increase fluids. RTC if symptoms worsen in the meantime.

FAMILY MEDICAL CENTER

CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

05-22-95
S:70 year old female complaining of rib pain that occurred two days after she was leaning over into a trash can to pick up aluminum can. She heard a snap in her right side at that time. Now the pain is constant and it hurts to walk or to breathe, interrupts her sleep. She uses an Ace bandage and this seems to help. She is eating and drinking well. No problems with bowel movements. No history of osteoporosis that she knows of. She has never had an injury to this area before.

O:Patient moves with care secondary to pain, does not take deep breaths. Tenderness is elicited at the tenth rib mid axillary line. Lungs CTA.

X-ray negative for fracture.

Abdomen is nontender.

A:Tenth rib pain right side secondary to bending over.

P:6" Ace wrap was used to wrap the chest. This brought her immediate comfort. She was reminded to take deep breaths since aspirin upsets her stomach suggested Tylenol p.r.n. pain. She is to call back or return to the clinic p.r.n. We talked about no heavy lifting or overexertion.

ROOSEVELT FAMILY MEDICAL CENTER
CLINIC NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

ADMITTING DIAGNOSIS: Bilateral lower extremity cellulitis.

SECONDARY DIAGNOSIS:
1.Recurrent lower extremity venous insufficiency ulcer, status post grafting.
2.Recurrent DVT thrombophlebitis, on Coumadin.
3.Distant history of seizure disorder.
4.History of reflux esophagitis.
5.Hypercholesterolemia.
6.History of positive PPD with negative chest x-ray in 1993.
7.Recurrent veritgo/dizziness of unknown etiology.
8.Bilateral chronic hearing loss.

OPERATIONS AND PROCEDURE ON THIS ADMISSION: Lower extremity venous duplex on 3/26/95, showed left iliac vein appearing to be clinically occluded with partial recannelization with history of thrombus seen in the proximal left common femoral vein. No acute deep vein thrombosis bilaterally.

HISTORY OF THE PRESENT ILLNESS: This is a 70-year-old female with history of severe venous stasis disease, status post graft and status post DVT, who presents with less than 24-hour history of bilateral spreading lower extremity erythema and induration. The patient was seen on 3/24/95, in the Family Medicine Clinic for minimal increasing erythema and edema and had negative Doppler of the upper and lower extremities at that time. The patient was started on Keflex q 6 h for two days prior to the current admission. The patient denied fever, chills, pain and shortness of breath with chest pain.

PAST MEDICAL HISTORY: As above. Status post TAH and BSO in 1971. Carpal tunnel release in 1989. Status post cataract surgery.

PHYSICAL EXAMINATION: On admission, examination revealed bilateral erythema with 3+ tense pitting edema bilaterally from the ankle to mid-calf level. The lower extremities feel warm to the touch with minimal tenderness, negative Homan's sign. No palpable calf cords. Capillary refills were less than 2 seconds. Dorsal pedis and posterior tibialis were palpable bilaterally. The erythema was worse on the left than the right moreover diffuse brown induration.

LABORATORY ON ADMISSION: Revealed a WBC of
6.3, hematocrit of 39, a PT of 17.3 seconds with an INR of 2.6. Blood culture was negative.

HOSPITAL COURSE: Upon admission, the patient was placed on Kefzol 1 gram IV q.8 h. and evaluation of both lower extremities, erythema and induration show significant response to the antibiotics and evaluation on the second and third days of hospitalization and on the fourth day of

hospitalization (which is today), the patient's erythema and induration have come back to baseline. The patient has nevere developed a fever on this current hospitalization, however, the patient has a small, superficial ulcer just posterior-inferior to the medial malleolus on right angle that has had some small amount of discharge.

A decision was made with concurrent agreement by Surgery, that an Unna boot would benefit the patient.

At discharge, the patient has an Unna boot on the right lower extremity and there was significant decrease in erythema and induration on both lower extremities.

DISCHARGE MEDICATIONS: Include Keflex 500 mg PO q.i.d. for 10 more days to complete a 14-day course of IV PO antibiotics. Other medication includes Coumadin 10 mg PO on Tuesday, Wednesday, Thursday, Saturday and Sunday; 7.5 mg PO on Monday and Friday. Tegretol 200 mg PO b.i.d. Trental 400 mg PO t.i.d. Mevacor 20 mg PO b.i.d.

The patient is to be followed up in the Surgery Clinic with Dr. Strandness in less than one week, at which time she should have her Unna boot removed.

LOW BACK STRAIN
S:Reports approx 2 wk h/o increased lumbar pain. Was working in her daycare and lifting children, perhaps more than usual, when she had an insidious onset of some especially left-sided low back discomfort. Some mild radiation to the buttock area but none more distal than that. Denies any leg weakness. No numbness or tingling. Bowel and bladder function has been completely normal. Denies any sensory changes about the perineum or in the lower extremities. Pt does have a h/o multiple low back strains in the past, and has used Motrin or Tylenol for discomfort 1-2 tabs/day. Otherwise is not icing or using any other treatment modalities.

O:Some mild paravertebral tenderness but no distinct muscle spasms of the erector spinae muscles. She has no bony defects palpable. Lower extremity strength is excellent, and she has bilateral negative leg raises. ROM at hip normal bilaterally. Knee mobility is full.

A:Low back strain.

P:1)Motrin 600 mg PO t.i.d. with instructions that if she has GI discomfort or upset to DC this medication.
2)Tylenol 325 mg, 1-2 PO q4-6h for discomfort. Have suggested pt ice her back 4-5 times/day 20 minutes per episode, and have given her a back care book which she can read ways she can optimize her back positioning and sleeping arrangements. Also to use some gentle stretching exercises to re mobilize her low back muscles.
3)RTC 4 wks if not completely better.

ANTICOAGULATION
S:Received phone call from pt requesting INR which was drawn yesterday. Pt denies any signs or symptoms of bleeding or bruising, and admits to being in generally good health. Current regimen has been 10 mg Coumadin T-Th-Sa-Su with 7 mg M-W-F. Pt admits to being compliant with this and has no other changes in her medication regimen or diet.

O:Today's INR was 1.2.

A:Inadequate anticoagulation on current regimen.

P:Change dose to 7 mg M-F and 10 mg the rest of the wk.

Discussed with pt the importance of her coming in to see a health care provider rather than just doing this over the phone with monthly lab values. Pt has not been seen since 10/25/94, at which time Dr. Neighbor performed full physical exam. Pt agreed to try to make appt as soon as she can get it in her schedule. (Pt babysits and needs to know days off of couple she babysits for.)

Will RTC in 2 wks for f/u INR value to see what dose change had done for her value.

RIGHT LOWER EXTREMITY SUPERFICIAL THROMBOPHLEBITIS
S:Patient seen in the emergency room for left leg cellulitis three days ago and treated with Keflex 250 mg qid and Una boot and followup with Dr. Ziegler or Strandness in Vascular Clinic on this Friday. Yesterday she developed redness about the right ankle.
O:Vital signs per chart. Afebrile. No acute distress. Ambulating satisfactorily. Examination reveals 8 x 4 cm area of redness with one tender superficial vein in the middle of this area of redness. There is no ankle edema. Homans' negative. No cords palpated in the calf. Left lower extremity not examined, as it is in an Una boot.
A:1) Right lower extremity superficial thrombophlebitis without evidence of infection. 2) Patient reported left lower extremity cellulitis being treated by Vascular Clinic.
P:1) Warm soaks 30 minutes bid to the right lower extremity and followup with Dr. Strandness in Vascular Clinic. 2) Increase Keflex dose to more usual dose which would be 500 mg qid. Followup again with Vascular Clinic.

SEATTLE, WASHINGTON 98195

ORTHOPEDIC CLINIC NOTE

Ms. Hoffman is a very pleasant 69-year-old female referred by Dr. Neighbor to evaluate her right knee. She is a bit of a difficult historian, but believes that she first injured her knee during a fall 9/13/94. At that time she had pain on her patella. Subsequently it was evaluated with x-rays on 9/21 and revealed an unusual fracture of the right lateral aspect of her patella, consistent with her pain over that area. She was treated conservatively and did relatively well. She does state that she fell approximately 1 mo later at the post office when her knee gave way and she has not had problems since then with giving-way. She denies any cracking, popping, walking, other mechanical symptoms. She overall is quite happy with her knee. She is able to walk approximately 1 mi, but does have pain over her patella when the weather changes.

EXAMINATION:
There is no effusion nor erythema over this area. She is nontender to palpation over the patellar retinaculum. She has range of motion of the knee from 0-140. There is no joint line tenderness, negative McMurray's. She is stable to Lachman's, negative patellar apprehension though she does have patellar crepitus.

A sunrise patellar view reveals no change in the alignment of the fracture.

ASSESSMENT/PLAN:
Patient with a healed right lateral patellar fracture. She appears to be doing well. She does have some symptoms when the weather changes, and this is commonly seen after a fracture. She has no evidence of ligamentous injury nor arthritis, and I think her symptoms will continue to improve with conservative measures. She need only return on a prn basis, though some strengthening may be of benefit to her, or something such as our Patellar Protection Program available at Physical Therapy here at the UWMC.

HM
69 YO female with multiple medical problems, followed in this clinic, in for HM examination. On stable Coumadin and Tegretol doses. No specific complaints today other than h/o night sweats for many many years. She recently had a right patellar fracture for which she has seen Dr. Mackenzie in our clinic and is apparently being referred to Bone & Joint.

CURRENT MEDICATIONS: Coumadin 5 mg qd. Lovastatin 20 mg qd. Tegretol 200 mg t.i.d. Trental 400 mg t.i.d.

O:VS and examination per forms in chart.

A:1)HM.
2)H/o seizure disorder since 1975.
3)H/o recurrent phlebitis and DVT.
4)Edema managed with lovastatin.
5)S/p TAHBSO for benign disease in the distant past.
6)Bilateral talonavicular joint arthritis, currently asymptomatic.
7)Recent right patellar fracture.
8)H/o borderline glucose in 1990 with subsequent testing being negative.

P:Flu vaccine today.
Mammogram in Jan 95, 2 yrs from last exam.
Cholesterol, protime, hct, Tegretol, TSH, creatinine, fasting blood sugar in 1 wk, and will call results to pt.
Stool occult blood testing kit given.

F/U RIGHT PATELLAR FRACTURE
S:Pt states improving significantly with minimal pain. Continues to use an ace wrap because feels occasionally her knee has a sensation of "dropping". No locking. Overall, she feels significantly improving.

O:No effusion or erythema. Patella mildly tender to palpation along the lateral aspect on the right, otherwise w/o tenderness. No tenderness along joint line. Medial collateral ligament and lateral collateral ligament w/o laxity. Anterior drawer ? positive with good end-point. Negative posterior drawer. Extension and flexion of right knee 5/5. Reflexes 2+ and symmetric. Left knee also examined and w/o effusion or laxity of ligaments.

A:Patellar fracture, healing well.
? of anterior cruciate ligament laxity.

P:Pt was also examined with Dr. Dobie, and our plan at present is for her to continue ace wrap as she feels it helps support her knee. Continue ROM and strengthening exercises.
F/u in 3 wks. We discussed possible referral at that time to Bone and Joint Clinic.

9/21/94
RIGHT KNEE PAIN
S:Pt was seen 9/13 after a fall on some concrete landing on her right knee. She states she continues to have pain in that region and difficulty ambulating. She has been wrapping her knee with an ace wrap, and otherwise taking her usual medications. No locking or instability.

O:Elderly female in moderate distress while ambulating around the room. LEFT KNEE: No effusion. No tenderness with palpation of patella. Good mobility. ligaments intact. RIGHT KNEE: Extreme tenderness over patellar region especially the lateral inferior surface, and guarding with any attempts at moving the patella. No effusion or ecchymosis evidence. Her medial and lateral ligaments are intact, however difficult to assess fully secondary to voluntary guarding. ROM: Able to go from 180 to about 70 degrees w/o difficulty, however some discomfort with full flexion. No tenderness along joint line. Negative Lachman's.

XRAY remarkable for a vertical fracture of the patella, displaced approx 3 mm, good approximation.

A:Patellar fracture.

P:Knee immobilizer given to pt. Recommended use 24 hrs per day, however remove 3-4 times/day for ROM exercises. She is to take care with ambulation to prevent further falls.

F/u 1 wk for evaluation. I will call and discuss with Ortho further recommendations.

9/13/94
KNEE PAIN
S:Pt reports tripping over the concrete while walking outside today and falling on her right knee and right outstretched hand. She does not report striking her hand or losing consciousness. Pt was able to ambulate immediately thereafter and continues to ambulate, however has noted some progressive stiffness in her right knee. She does not c/o anything but mild soreness on her right palm.

O:Elderly female in NAD. EXTREMITIES: Mild ecchymosis on right palm. Right knee exam shows superficial abrasion above the patella in the midline. No obvious swelling. Pt is able to perform extension to 180 with moderate discomfort and flexion to about 80 with moderate discomfort. On palpation, the right knee is tender on the lateral side at about the joint line, however there is no sign of focal injury or swelling or erythema at that point. The patella is also tender in the area of the abrasion. There is no evidence of effusion. Left upper and left lower extremities both unremarkable.

A:Mild abrasion of right knee with soft tissue damage.

P:Advised to rest, elevate, and apply ice to the knee the first 24 hrs after injury, and to take extra caution when ambulating to prevent a secondary fall given her decreased ROM.

Pt also advised to RTC if her symptoms do not begin to improve after a few days or if there are signs of increasing swelling in her joint as she is on chronic anticoagulation therapy.

7/16/94:

RIGHT FOOT PAIN:

S:The patient walked in at the end of Saturday morning clinic, this morning, with a complaint of difficulty with pain in her right foot. She, per the receptionist, was able to walk reasonably well to the reception desk, but had much more difficulty walking from the reception desk to the room with the Medical Assistant. The patient gives a history of increasing pain which grabs her in her foot on the right, leaving her for as much as 10 minutes at a time being unable to walk on that foot. She has no known injury; she does not have a lot of pain when she doesn't weight bear, per her, but as soon as she tries to weightbear. At times externally rotating her foot seems to give her less pain and she states that over the last month she has been definitely favoring that foot.
O:No swelling or signs of ecchymosis. She holds the foot quite still and is somewhat stiff to move it in any direction, walking is extremely limited. She seems to have difficulty even lifting the foot as she walks, but at other times seems to walk better. She localizes the pain somewhat to the top dorsal aspect of her right foot, much in the area where her left foot bothered her, exactly a year ago, per Dr. Neighbor's note. However, when distracted, firm pressure on the same area doesn't seem to elicit pain.
A:Very difficult to know the etiology of this kind of pain, but it is clearly making her favor this foot in a way that is disturbing her gait.
P:The patient will try ice to this area three times a day and will ace-wrap it if that makes her more comfortable and I strongly encouraged her to try to walk more normally. She will follow up with Dr. Neighbor in one week's time and they can determine further work-up at that point.

FAMILY MEDICAL CENTER

CLINIC
NOTE

UNIVERSITY OF WASHINGTON MEDICAL CENTER
1959 N.E. PACIFIC STREET
SEATTLE, WASHINGTON 98195

RIGHT OTITIS EXTERNA

Pt has not yet used hydrogen peroxide drops. Symptoms have resolved.

HYPERCHOLESTEROLEMIA

Failed ot have cholesterol level measured at her last visit. Continues on lovastatin. Will check cholesterol at her next blood draw for PT which will be in 1-2 wks. F/u 1 month.

EPIGASTRIC PAIN/LUMBOSACRAL SPINE PAIN

Since her last visit, epigastric discomfort has completely resolved with Zantac 150 mg b.i.d. No further N&V such that she is now able to keep her medications down. Coincidentally, her back pain has improved and she is now only taking Tylenol each day. No ibuprofen.

O: Wt 166#, down approx 4# since last visit. BP 130/86. P 88 and regular. No abd discomfort on examination. LS SPINE XRAYS at last visit revealed mild kyphoscoliosis and moderate DJD. Aortic calcifications were incidentally noted w/o any evidence of aortic dilation.

A: 1) Acute gastritis resolved on H2 blockers and with decreased use of nonsteroidals.
2) DJD by xray of LS spine, currently controlled with simply use of Tylenol.

P: 1) Continue Zantac for a total of 6 wks.
2) Recheck 1 month.

RECURRENT SHARP CHEST PAIN

S: 2 wk h/o recurrent bilateral sharp nonradiating chest pain causing her to hold her breath. No other assoc cardiopulmonary symptoms. Sharp chest pain is fleeting in nature.

O: No JVD. CHEST clear. COR: Sl, S2 normal w/o murmur, gallop, or rub. There is chest wall tenderness over the lower costochondral junctions though the pt says this does not exactly duplicate the pain she has experienced.

A: Sharp chest wall pain w/o evidence of cardiopulmonary origin.

P: Tylenol prn.
Expect resolution as this has only been present for approx 2 wks.

ANTICOAGULATION:

S: The patient comes in for left calf swelling and tenderness times two days. She had been taking stable doses of coumadin 10 mg Thursdays and Sundays, and 7.5 mg on other days. This dose had been stable for 5 months.

O: INR today 1.5.

A: Inadequate anticoagulation despite stable dose of 10 mg Thursday, Sunday and 7.5 mg other days which had maintained stable INR between 2.0 and 2.5 for five months. As Doppler showed, there was a 3 cm thrombosis of peroneal vein at mid-calf

P: Increase dose of coumadin to 10 mg q.d. except 7.5 mg Monday, Wednesday Friday and follow up INR in one week.

SEATTLE, WASHINGTON 98195

CONSULTATIONS: None.

PROCEDURE: None.

IDENTIFICATION/CHIEF COMPLAINT: The patient is a 69-year-old female with a history of bilateral lower extremity cellulitis, chronic venous stasis, and healed lower extremity ulcers, and deep venous thromboses. She had been complaining of one day of increasing lower extremity pain and erythema. The patient denied any trauma to the area. She was seen in clinic two days prior to admission complaining of dizziness, and was diagnosed with viral labyrinthitis and bilateral otitis media. She was started on Keflex 250 mg qid. Her recent prothrombin time and Tegretol levels had been therapeutic.

PAST MEDICAL HISTORY: See chart.

ADMISSION PHYSICAL EXAMINATION: VITAL SIGNS: Afebrile; stable. GENERAL: Pleasant female, in no acute distress. She had tangential speech. LOWER EXTREMITIES: Remarkable for hyperpigmented, chronic venous stasis changes; bright erythema; warmth over the medial anterior surface of her right leg, and the anterolateral surface of her left leg, extending from her ankle to mid shin. No skin breakdown or ulcerations.

LABORATORY DATA: Remarkable for white count 8.7, hematocrit 44, prothrombin time 16.7, INR 2, and sodium 153. Other electrolytes were normal.

HOSPITAL COURSE:
1. BILATERAL LOWER-EXTREMITY CELLULITIS:
Although the patient was afebrile and had a normal white count, she had been on oral Keflex for two days, and thus the decision was made to admit her for intravenous antibiotics. She was started on Kefzol and received a 24-hour course, with improvement of the erythema. She also had her legs elevated throughout this time. The patient then was switched back to Keflex 500 mg qid and watched a further 24 hours, with continued improvement of the erythema and swelling. The patient was discharged home, to complete a seven-day course of Keflex 500 mg po qid.

2. ANTICOAGULATION:
The patient was therapeutic on admission and remained therapeutic throughout the hospital course.
There was no evidence of deep venous thrombosis, with symmetric, bilateral cellulitis.

3. OTHER PROBLEMS:
The patient's seizure disorder and recurrent dizziness were stable throughout admission.

4. HYPERNATREMIA:
The patient's sodium on admission was 152, with normal glucose. Old records show this is a chronic problem, most likely secondary to empiric thirst mechanism and chronic baseline mental status changes. The patient is not clinically volume depleted. She was given a bolus of normal saline, and sodium came down to 148, which is her baseline, on discharge to home.

DISCHARGE MEDICATIONS:
Keflex 500 mg po qid x7 days;
Coumadin 7.5 mg MTWFSun, and 10 mg ThSat;
Trental 400 mg po tid;
Meclizine 25 po bid;
Tegretol 200 mg po tid;
Lovastatin 20 mg qd.

DISCHARGE PLANS: The patient was advised to continue leg elevation for one-half hour at least three times a day, and to follow up at her already scheduled appointment on 4/4/94, or sooner prn increasing pain or erythema.

CELLULITIS

S: Pt was last seen in the clinic several days ago for diagnosis of viral labyrinthitis and bilateral OM. She has been taking her Keflex and Meclizine as prescribed and is improved in those symptoms. Today, she reports increasing pain and redness over her lower extremities bilaterally. She denies any trauma to the area, fevers, or chills.

O: T 36.6 PO. LOWER EXTREMITIES have marked erythemas and increased temperature over the right anterior lower extremity and the circumferential left lower extremity midway down, but not involving the foot. There is no obvious recent trauma, though there are superimposed chronic venous stasis changes and scarring from previous ulcers. There is no pitting edema, streaking, or fluctuance.

A: Lower extremity cellulitis in pt recently on antibiotics in the setting of chronic venous stasis ulcers and h/o DVTs.

P: Admit to Family Medicine Service for IV antibiotics and leg elevation.

DIZZINESS

S: 68 YO woman with multiple medical problems including seizure disorder, hearing loss, psychological disorder, and recurrent phlebitis, on Coumadin and antiplatelet agents. She reports that she has had a URI for the past several wks which seems to be improving. On Sunday, she noted the onset of positional dizziness, not assoc with vertigo, but more a sense of imbalance and that she would fall down. This seemed to resolve with sitting down. She does report an adequate fluid intake w/o fevers, nausea, vomiting, or diarrhea. She also denies ear pain, amaurosis fugax, or weakness in her extremities.

O: Wt 167#. BP 150/88. P 72. T 37.0. She is a fatigued-appearing woman wearing dark glasses who reports she is chronically unable to open her eyes fully secondary to photophobia. HEENT: TMs show central erythema bilaterally w/o retraction or fluid. Eyes are difficult to examine secondary to above-named problem. There is no obvious nystagmus. Mouth is with normal oral mucosa, no erythema. NECK supple w/o adenopathy. CN II-XII intact. DTRs are 2+ on the right knee and ankle jerk, absent on the left knee and ankle jerk. (Pt states this has always been the case.) Toes are down going. She has a positive Barany's test and does seem to list toward the left when she stands up immediately, though this resolves.

A: 1) Bilateral OM, early.
2) Viral labyrinthitis.

P: 1) Keflex 250 mg PO q.i.d.
2) Meclizine 25 mg PO b.i.d. X 5 days.
3) Conferred with Hana Benko Pharm D, and the above medications should not interfere with her Tegretol, Coumadin, and antiplatelet agents.
4) F/u 1-2 wks or sooner prn no improvement.
5) Push PO fluids.

~EXAMINATION:
XR T SPINE 2 VIEWS

CLINICAL INDICATION:
slow fall yesterday in house. Now tender over T10-T11 in midline

COMPARISON:
CT chest July 24, 2019

FINDINGS:
S-shaped curvature of the thoracolumbar spine is again demonstrated. Generalized osteopenia is present. There are mild anterior compression fractures of T11, T12, L1, L2. Comparison with the chest CT suggests some progression at the T11 level, although this appears more chronic than acute. Overall, sensitivity is somewhat limited because of osteopenia and spinal curvature.

~RADIOGRAPH OF THE CHEST, 1 VIEW

CLINICAL INDICATION:
fever

COMPARISONS:
8/1/2019

FINDINGS AND IMPRESSION:
There is new patchy opacification within the bilateral mid and lower lungs and increased prominence of the interstitium which may represent mild superimposed edema. Findings are concerning for multifocal pneumonia in setting of fever including atypical/viral pneumonia.

No effusion or pneumothorax.

Heart size is normal and unchanged.

No acute osseous abnormality. The right AC joint is not visualized. Mild left AC joint and shoulder osteoarthritis. Soft tissues are normal.

~EXAMINATION:
CTA NECK ANGIO

CLINICAL INDICATION:
Stroke Code

TECHNIQUE:
CTA Head and Neck Stroke (N-48)
1. Non-contrast head: MDCT scanning was obtained through the head without contrast.
2. CTA Head/Neck: MDCT was obtained from the aortic arch to the vertex during bolus infusion of contrast. Slab 3D-MIP reformatted images of extracranial and intracranial vessels were obtained in multiple planes.
3. Post-contrast head: MDCT was obtained through the head after contrast injection.
Patient age specific scan parameters and iterative reconstruction techniques were used for radiation exposure.

CONTRAST:
Omnipaque 350 mg-ml 80 ml 05/27/2020 06:08 PM INTRAVENOUS

COMPARISON:
CT head without contrast 7/24/2019

FINDINGS:

NON-CONTRAST HEAD CT:
MASS EFFECT & VENTRICLES: No midline shift shift. The lateral ventricles are symmetric. Incidentally noted is a septum cavum pellucidum. Prominence of the ventricular system and extra-axial spaces is commensurate with mild cerebral volume loss. Basal cisterns are patent. No downward herniation.
BRAIN: No acute infarct, hemorrhage or mass lesion is seen. Mild periventricular and deep subcortical white matter hypodensities likely representing small vessel ischemic changes. Bilateral basal ganglia mineralization. Similar left parietoccipital calcification.
VASCULAR: Moderate calcification of bilateral cavernous carotids and intracranial segments of the vertebral arteries.
EXTRA-AXIAL: No abnormal extra-axial fluid collections or masses.
EXTRA-CRANIAL: Skull and facial bones are normal. Sinuses and mastoids are clear. Bilateral lens replacement. Orbits are otherwise normal.

POST-CONTRAST HEAD CT:
ENHANCEMENT: Normal intracranial enhancement.

HEAD CTA:
ARTERIES: Normal intracranial arteries. No aneurysm, AVM, stenosis or occlusion.
VARIANTS: Circle of Willis is normally developed. No other vascular anatomic variants.
VEINS: Dural sinuses and deep venous structures are normal.

NECK CTA:
AORTIC ARCH: Common origin of the brachiocephalic and left common carotid arteries from the arch, a normal variant anatomy.
CAROTIDS: Common carotid vessels are normal. Mild calcified plaque at the carotid bulbs/origins of the bilateral ICAs without significant stenosis. Additional calcified plaque within the bilateral carotid canals, cavernous carotids and supraclinoid ICAs. Fusiform aneurysmal dilation of the right supraclinoid ICA to the circle of Willis measuring up to 0.6 cm. Internal carotid artery origins show no stenosis. Cervical ICA's are normal.
VERTEBRALS: Focal calcifications at the origins of the bilateral vertebral arteries without significant stenosis. There is flattening of the left vertebral artery within the V3 segment (12/132), although the more distal segments are well perfused. Right cervical segments are normal. Right vertebral artery is dominant.

IMPRESSION:
1. Head CT
- No acute infarct, hemorrhage or mass effect.
- Mild cerebral volume loss and sequela of chronic ischemic microvascular disease.
2. CTA head
- No high-grade stenosis or occlusion.
- Fusiform aneurysmal dilation of the right supraclinoid ICA measuring up to 0.6 cm.
3. CTA of the neck vessels
- No high-grade stenosis, dissection or occlusion.
- Mild calcified plaque in the bilateral carotid bulbs without significant ICA stenosis.

Internal carotid artery origin stenosis by NASCET criteria: No significant stenosis by NASCET criteria.

This is a preliminary report by Dr. Aaron Daub (PGY-5). A final report will be available by 10:00 AM on the following morning, or after 3 PM on weekends and holidays. Unless a final report appears below, an attending Radiologist has not yet reviewed the images.

ATTENDING FINAL REPORT

I agree with the preliminary report with the following comment(s) (Cat 2): There is a 5 mm smooth, non-spiculated nodular density in the right medial lung (series 12, images 1 through 3).

IMPRESSION:
See impression above.

PULMONARY NODULE MANAGEMENT RECOMMENDATIONS:

Pulmonary nodules are a common incidental finding on CT If there is prior imaging such as a chest radiograph or CT available at another facility, this should be compared to assess for stability.

Solitary non-calcified pulmonary nodule less than 6mm. In patients with a low risk of malignancy, no follow-up imaging is recommended for this nodule (less than1% risk of malignancy). In patients at higher risk, an optional low-dose CT of the chest in 12 months is recommended. Risk factors include current smoking, recently quit smoking, morphology (e.g. spiculated margins).

Accredited by the Intersocietal Accreditation Commission - Vascular Testing

EXAMINATION:
LOWER EXTREMITY VENOUS DUPLEX (BILATERAL)
Venous duplex examination performed using B-mode, color flow, and Doppler spectral waveform assessment.

INDICATION:
This is a 95 year-old woman with a history of DVT. The patient presents with a palpable lump in the medial left distal thigh-knee area.

PREVIOUS EXAMINATIONS:
11/2/2016 (Left external iliac vein is chronically occluded with collaterals noted)

EQUIPMENT:
GE Logic 9

FINDINGS:

LOWER EXTREMITY VENOUS DUPLEX

RIGHT DEEP SYSTEM
Common Femoral Vein: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes
Deep Femoral Vein: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes

Main Femoral Vein Prox: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes
Main Femoral Vein Mid: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes
Main Femoral Vein Dist: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes

Popliteal Vein: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes

Posterior Tibial Vein: Not evaluated due to wound wraps.
Peroneal Vein: Not evaluated due to wound wraps.

Gastrocnemius Veins: Not evaluated due to wound wraps.
Soleal Veins: Not evaluated due to wound wraps.

RIGHT SUPERFICIAL VENOUS SYSTEM
Great Saphenous Vein: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes at the saphenofemoral junction.

LEFT DEEP SYSTEM
Common Femoral Vein: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes
Deep Femoral Vein: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes

Main Femoral Vein Prox: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes
Main Femoral Vein Mid: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes
Main Femoral Vein Dist: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes

Popliteal Vein: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes

Posterior Tibial Vein: Not evaluated due to wound wraps.
Peroneal Vein: Not evaluated due to wound wraps.

Gastrocnemius Veins: Not evaluated due to wound wraps.
Soleal Veins: Not evaluated due to wound wraps.

LEFT SUPERFICIAL VENOUS SYSTEM
Great Saphenous Vein: Complete compressions, spontaneous and phasic flow, complete color filling, no intraluminal echoes at the saphenofemoral junction.

Shannon Wear,BS,RVT
Vascular Technologist

Karina Newhall
Vascular Fellow

FINAL PHYSICIAN INTERPRETATION

1. RIGHT LOWER EXTREMITY VENOUS
- No deep vein thrombosis in the right lower extremity, where evaluated.
- The deep veins in the right calf were not evaluated due to wounds and bandages.
- No superficial vein thrombosis in the right lower extremity, where evaluated.

2. LEFT LOWER EXTREMITY VENOUS
- No deep vein thrombosis in the left lower extremity, where evaluated.
- The deep veins in the left calf were not evaluated due to wounds and bandages.
- No superficial vein thrombosis in the left lower extremity, where evaluated.
- In the area of the palpable lump in the left medial knee area there is a non-vascularized, mixed echogenicity, solid-appearing structure located about 2 cm below the skin surface and measuring 1.9 x 1.2 cm.

XR SHOULDER MIN 2 VIEWS RIGHT, XR HUMERUS MIN 2 VIEWS RIGHT

CLINICAL INDICATION:
Fell a couple of days ago. Now right shoulder pain in 94 year old with osteoporosis and hx of fx

COMPARISON:
No prior images are currently available for comparison.

FINDINGS:
Bones are osteopenic.
There is mild osteoarthritis at acromioclavicular and glenohumeral joints.
Calcification at the acromiohumeral interval is in keeping with calcific rotator cuff tendinosis.

A minimally displaced fracture is noted at the greater tuberosity.

Superior Extent: T1
Inferior Extent: Sacrum

COMPARISON:
MRI thoracic spine 9/17/2018, radiographically lumbar spine 10/22/2014, and other priors

FINDINGS:
ALIGNMENT: Minimal anterolisthesis of L5 on S1. Left convex scoliosis of the lumbar spine with a Cobb angle of approximately 21 degrees.
VERTEBRAE/BONES: Again seen are chronic compression fractures of T12-L3. Cortical irregularity at the posterior aspect of the L1 vertebral body with correlate on MRI dated 9/17/18. Consider repeat MRI if pain persists in this region. No acute vertebral fractures. Diffuse osteopenia.

Partially visualized multiple rib fractures, some of which are chronic:
-Chronic fracture deformities of the right 10-12th posterior ribs.
-Acute mildly displaced fractures of the right posterior 8th and 9th ribs.

Partially visualized right femoral head/neck instrumental fixation.

Minimally displaced right sacral zone 1 fracture (604B/74 and 305B/166) with intra-articular extension into the SI joint.

HARDWARE: No spinal hardware present.
CORD: Visualized throracic cord and conus medularis are normal size.

SOFT TISSUES: Please refer to same day CT chest abdomen and pelvis for extraspinal findings. Paravertebral, interspinous, and posterior soft tissues are normal.

LEVELS: No central stenosis. Mild bony right neural foramen narrowing at L5-S1. ABNORMAL LEVELS: Partial bony fusion of T3-T4. Severe disc space narrowing at L4-L5.

IMPRESSION:
No acute thoracolumbar spinal fractures or malalignment. Again seen are chronic compression fractures of T12-L3, with posterior cortical irregularity at L1. If patient's back pain persists, consider repeat MRI for further evaluation.

Minimally displaced right sacral zone 1 fracture with intra-articular extension into the SI joint.

Acute displaced fractures of the right posterior eighth and ninth ribs. Chronic fracture deformities of the right 10th-12th posterior ribs. Please refer to same day chest, abdomen, and pelvis CT for further description of rib fractures.

Moderate to severe multilevel degenerative changes of the thoracolumbar spine as detailed above.

The above findings were communicated to Nemanich by Moran at 7/24/2019 3:23 PM.

~EXAMINATION:
CT CHEST ABDOMEN AND PELVIS W CONTRAST

CLINICAL INDICATION:
GLF. Additional history: 94-year-old female patient with a ground level fall yesterday presented with the back, right side and right hip pain.

TECHNIQUE:
CTB A15 CT Chest Abdomen Pelvis with IV contrast.
Contiguous axial sections were obtained through the chest, abdomen and pelvis with IV contrast only. Multiplanar reformatted images were performed. Automated exposure control and statistical iterative reconstruction techniques substantially lowered patient radiation dose.

CONTRAST:
Omnipaque 350 mg-ml 88@2.2 ml 07/24/2019 02:03 PM INTRAVENOUS

COMPARISON:
None.

FINDINGS:
CHEST:
Thyroid: Unremarkable.
Thoracic lymph nodes: No lymphadenopathy by size criteria.
Mediastinum and esophagus: Moderate sliding hiatus hernia.
Heart and vasculature: Moderate to severe coronary artery disease. Atherosclerotic changes of the aorta. Aortic wall calcifications.
Lungs: Unremarkable.
Pleura: Right sided hydropneumothorax with no mediastinal shift. Trace left pleural effusion.
Chest wall: Slightly displaced fracture right posterior eighth and ninth rib. No fracture is noted involving right seventh rib at the costovertebral junction.

ABDOMEN:
Liver: Unremarkable.
Gallbladder: Distended with no opaque stones
Bile ducts: Prominent CBD measuring 9 mm (601/54) with associated mild intrahepatic biliary radical dilatation. CBD seen) distally towards the pancreas with no obvious lesions in the periampullary region.
Spleen: Unremarkable.
Pancreas: Unremarkable.

Adrenals: Unremarkable.
Kidneys and Ureters: Bilateral renal cortical hypodense lesions, the small lesions are too small to characterize while the larger lesions are likely cysts.

Abdominal Lymph Nodes and Retroperitoneum: No lymphadenopathy by size criteria.
Vasculature: Moderate aortobiiliac atherosclerotic disease with no aneurysmal dilatation of the aorta.
Bowel: Unremarkable.
Peritoneum and Abdominal Wall: Mild ascites. No abdominal collections. No pneumoperitoneum.

PELVIS:
Pelvic Viscera: Unremarkable.
Bladder: Unremarkable.

BONES:
-Two fracture lines involving the right inferior pubic ramus (3/213-216).
-Severe spondylo-degenerative changes of the spine with scoliotic deformity and mild wedging of L2 and T11 vertebral bodies, age indeterminate.
-Osteopenia. Right hip arthroplasty.

IMPRESSION:
1. Multiple right-sided rib fractures with right-sided hydropneumothorax.
2. Fracture right inferior pubic ramus. L2 and T11 vertebral body age-indeterminate wedge fracture.
3. Prominent CBD with mild intra-hepatic biliary radicle dilatation. Recommend correlation with liver function tests and further evaluation with MRCP if clinically indicated.

CT HEAD WO CONT

CLINICAL INDICATION:
GLF, x

TECHNIQUE:
CT Head Routine wo contrast (N-1)
Contiguous axial sections were obtained through the head without contrast.
Patient age specific scan parameters were used for radiation exposure.

COMPARISON:
CT head 3/29/2018.

FINDINGS:
Field-of-view does not contain the anterior mandible.

MASS EFFECT & VENTRICLES: No midline shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.
BRAIN: Mild to moderate cerebral volume loss. Few unchanged scattered parenchymal calcifications. Unchanged mild to moderate periventricular white matter hypoattenuation. No acute infarct, hemorrhage or mass lesion is seen.
VASCULAR: Severe vascular calcifications involving of the common carotids and cavernous ICAs.
EXTRA-AXIAL: Extra-axial spaces are normal.
EXTRA-CRANIAL: Skull and facial bones are normal. Sinuses and mastoids are clear. Orbits are normal.

IMPRESSION:
No acute intracranial hemorrhage, infarct, or masses.

Similar cerebral volume loss and periventricular white matter hypoattenuation consistent with chronic microvascular ischemia.

CT C SPINE WO CONT

CLINICAL INDICATION:
GLF, x

TECHNIQUE:
Cervical Spine wo contrast: routine (N-53)
MDCT scanning was obtained through the cervical spine without contrast. Coronal and sagittal reformatted images were performed.
Patient age specific scan parameters and iterative reconstruction techniques were used for radiation exposure.

Inferior Extent: T4

COMPARISON:
C-spine CT 12/7/2012

FINDINGS:
ALIGNMENT: Normal alignment.
VERTEBRAE: Vertebral body height and density are normal. No fractures or destructive lesions.
HARDWARE: No hardware present.
DISCS: Normal disc height
SOFT TISSUES: Prevertebral, interspinous, and posterior soft tissues are normal. Multiple tiny hypodense thyroid nodules.

AXIAL DISCS AND FORAMINA:
Similar posterior subluxation of the right atlantoaxial articulation (602/91). Moderate degenerative changes of the cervical spine including multilevel disc height loss, mild facet arthropathy, and fusion of the C4-5 posterior elements. Diffuse osteopenia.

C2-3: No central or foraminal stenosis.
C3-4: No central or foraminal stenosis.
C4-5: No central or foraminal stenosis.
C5-6: No central or foraminal stenosis.
C6-7: No central or foraminal stenosis.
C7-T1: No central or foraminal stenosis.

Right small-to-moderate pneumothorax.

IMPRESSION:
1. No acute fractures of the cervical spine. Stable degenerative changes. Diffuse osteopenia.

2. Right small to moderate pneumothorax.

The above findings were communicated to Antonia Nemanich M.D. by Thomas Eggert M.D. PGY-3 at 7/24/2019 2:04 PM.

CT HEAD WO CONT

CLINICAL INDICATION:
Altered mental status, visual hallucinations

TECHNIQUE:
CT Head Routine wo contrast (N-1)
Contiguous axial sections were obtained through the head without contrast.
Patient age specific scan parameters were used for radiation exposure

COMPARISON:
7/15/2015

FINDINGS:
MASS EFFECT & VENTRICLES: No shift. The lateral ventricles are symmetric. The ventricles, sulci and cisterns are normal.
BRAIN: Moderate global parenchymal volume loss. Unchanged calcification of bilateral basal ganglia and focal calcification the left posterior periventricular white matter. Scattered foci of hypodensities in the periventricular and subcortical white matter, likely chronic microvascular ischemic disease. No acute large infarct or intraparenchymal hemorrhage.
VASCULAR: Atherosclerosis of the cavernous carotids and vertebral arteries
EXTRA-AXIAL: Extra-axial spaces are normal.
EXTRA-CRANIAL: Bilateral lens replacements. Scalp is normal. Sinuses are clear. Mastoids are clear

IMPRESSION:

No acute infarct, hemorrhage or mass effect.

Preliminary results and a final report will be available for review by 10am the following morning Monday through Friday or after 3pm Saturday/Sunday and holidays.

Unless a final report appears below, an attending Radiologist has not reviewed the images.

*****

ATTENDING FINAL REPORT

I agree with the preliminary report (Cat 1).

IMPRESSION:

1. No acute intracranial abnormalities identified.

2. Chronic microvascular ischemic changes. Mild cerebral volume loss.

~Indication
========

This is a 92 year old woman with a history of deep vein thrombosis. The patient presents with left lower extremity wounds. We are asked to evaluate lower extremity arterial perfusion prior to starting compression wraps.

History
======

General History
Other: Previous Examinations: 3/3/2010.

Method
======

Ankle/Brachial Index
Toe/Brachial Index.

Pressure Lower
============

Rt brachial A syst BP 132 mmHg
Rt dors pedis A BP 130 mmHg
Rt toe BP 92 mmHg
Rt ABI (rt dors ped A BP / max brach A BP) 0.98
Rt TBI (rt toe BP / max brach A BP) 0.70
Lt brachial A syst BP 130 mmHg
Lt dors pedis A BP 144 mmHg
Lt toe BP 90 mmHg
Lt ABI dors ped (lt dors ped A BP / max brach A BP) 1.09
Lt TBI (lt toe BP / max brach A BP) 0.68
Other: Prior ABI from 3/3/2010: Right 1.17, Left 1.01

Doppler flow waveforms were recorded:
Right posterior tibial artery was not insonated.
Right anterior tibial artery has biphasic Doppler flow waveforms.
Left posterior tibial artery has resistive monophasic Doppler flow waveforms. (incompressible)
Left anterior tibial artery has biphasic Doppler flow waveforms.

Right great toe has normal photoplethysmographic (PPG) volume pulse waveforms.
Left great toe has normal photoplethysmographic (PPG) volume pulse waveforms.

Impression
=========

1. The resting ankle/brachial indices may not be reliable due to medial calcification resulting in non-compressible tibial arteries and artificially high measured ankle
pressures. The values obtained are borderline normal on the right 0.98 and normal on the left at 1.09 (previously right 1.17 and left 1.01 on 3/3/2010).
2. Distal tibial artery flow waveforms are normally multiphasic to strongly monophasic bilaterally.
3. The toe/brachial indices are normal on the right at 0.70 and borderline abnormal on the left at 0.68 (normal toe brachial index is 0.70 or greater).
4. The great toe volume pulse waveforms are normally pulsatile bilaterally.

~EXAMINATION:
XR KNEE 4 MIN VIEWS RIGHT

CLINICAL INDICATION:
fall 7/6 with continued pain, medial joint line

COMPARISON:
Same day tibia-fibula radiographs; knee radiographs 5/2/2007

FINDINGS:

No fractures or dislocations. No joint effusion or soft tissue abnormalities.

There is mild osteoarthritis, worse in the medial and patellofemoral compartments. There is an enthesophyte at the quadriceps tendon insertion.

There are vascular calcifications.

PAGE 1 OF 1

U3047

WHITE - MEDICAL RECORD

UH3047 REV DEC 11

~Indication
========

Follow up thyroid nodules incidentally seen on CT cervical spine..

Method
=======

Thyroid ultrasound with image documentation. Satisfactory view.

Thyroid
=======

no thyroid resection.

RIGHT
Echogenicity: homogeneous
Vascularity: normal
Size: normal
Size: L/W/H 4.6 cm x 1.7 cm x 1.3 cm
Vol.: 5.3 cm
Nodules: There are multiple subcentimeter well defined smooth marginated nodules seen. Two are mixed solid and cystic in appearance and all 3 have no calcifications in them.

LEFT
Echogenicity: heterogeneous
Vascularity: increased
Size: normal
Size: L/W/H 4.0 cm x 1.4 cm x 1.5 cm
Vol.: 4.4 cm
Nodules: There are multiple subcentimeterwell defined smooth marginated nodules seen, most are cystic in appearance and have no calcifications

Isthmus
=======

AP 0.1 cm.

Impression
=========

Small subcentimeter bilateral thryoid nodules with no suspicious features..

~UNIVERSITY OF WASHINGTON MEDICAL CENTER
D.E. Strandness, Jr. Vascular Laboratory
Accredited by the Intersocietal Commission for the Accreditation of Vascular Laboratories (ICAVL)

Exam:
LOWER EXTREMITY VENOUS DUPLEX (RIGHT)

Indications & Symptoms:
This is an 88 year old woman with a history of DVT and superficial thrombophlebitis. She presents with new right leg pain.

Comparison:
4/13/2007: No acute DVT of the right or left lower extremities. Vein wall thickening through the right femoral vein.

Technique:
EQUIPMENT: GE Logic 9

Findings:
LOWER EXTREMITY VENOUS DUPLEX (RIGHT)

RIGHT SIDE
Deep System:
Doppler flow signals obtained in the common femoral, proximal profunda femoris, main thigh femoral, and popliteal veins are spontaneous, phasic and augmentable. Complete vein wall compression is noted on B-mode image (including gastrocnemius branches where applicable).

Paired posterior tibial and peroneal calf veins demonstrate augmentable color-Doppler flow signals. Complete vein wall compression is noted on B-mode image (including soleal muscular branches where applicable).

Superficial System:
The proximal great saphenous vein (GSV) demonstrates Doppler flow patterns that are spontaneous, phasic and augmentable. Complete vein wall compression is noted on B-mode image at the saphenofemoral junction. The GSV is small and non-continuous through the thigh, consistent with chronic occlusion. The GSV through the calf is compressible with some branches partially compressible. There are no dilated veins at the lateral-posterior calf - the site of her focal pain.

LEFT SIDE
Deep System:

Doppler flow signals obtained in the left common femoral vein arespontaneous, phasic and augmentable, symmetrical to the right.

Dr. Neighbor was contacted today at 1345 and the preliminary results of this examination were discussed.

Impression:
Kari A. Campbell, BS, RVT
Vascular Technologist

FINAL PHYSICIAN INTERPRETATION

No apparent change compared to the previous exam on 4/13/2007.

LOWER EXTREMITY VENOUS DUPLEX
1. Right:
- No evidence of acute deep venous thrombosis in the right lower extremity. The main thigh femoral vein has thickened walls, consistent with a prior episode of deep vein thrombosis.
- There is evidence of nonocclusive superficial thrombosis of the right great saphenous vein in the medial calf. However, it is not possible to reliably determine the acuity of this superficial venous thrombosis with ultrasound. No other superficial venous thrombosis in the right lower extremity.
- There is no superficial venous thrombosis in the lateral-posterior right calf area which is the site of her focal pain.

Accredited by the Intersocietal Commission for the Accreditation of Vascular Laboratories (ICAVL)

Exam:
CAROTID ARTERY DUPLEX

Indications & Symptoms:
Vertigo

This is an 88 year old woman who has experienced several recent episodes of vertigo.

Comparison:
None.

Technique:
EQUIPMENT: Philips iU-22 Ultrasound System

Findings:
CAROTID ARTERY DUPLEX
---------RIGHT--------LEFT
Common Carotid Artery Proximal---- 105cm/s----- 94cm/s
Common Carotid Artery Mid---------95cm/s-----108cm/s
Common Carotid Artery Distal------89cm/s----- 103cm/s
Plaque/Calcification----------N----------N

Carotid Bulb Flow Separation------Y----------Y
Internal Carotid Artery Proximal--45cm/s--77cm/s
Internal Carotid Artery Mid-------87cm/s--94cm/s
Internal Carotid Artery Distal----103cm/s--100cm/s
Plaque/Calcification----------Y----------Y

External Carotid Artery----------86cm/s-----88cm/s
Plaque/Calcification----------N----------Y

Vertebral Artery---------- 95cm/s----- 69cm/s
Antegrade----------Y----------Y

Subclavian Artery----------111cm/s----- 148cm/s
Plaque/Calcification----------N----------N

Brachial Blood Pressures----------138mmHg---134mmHg

The diagnostic criteria used to interpret this carotid duplex examination include parameters that compare the site of stenosis to the normal distal internal carotid artery diameter, as described in the NASCET study.

Impression:
Vascular Technologist
Watson Smith BA RDMS-RVT

FINAL PHYSICIAN INTERPRETATION

1. RIGHT
-1-15% diameter reduction of the right internal carotid artery.
-Common carotid artery is normal.
-External carotid artery is normal.
-Vertebral artery has normal, antegrade flow.
-Subclavian artery is normal.
2. LEFT
-1-15% diameter reduction of the left internal carotid artery.
-Common carotid artery is normal.
-External carotid artery is normal.
-Vertebral artery has normal, antegrade flow.
-Subclavian artery is normal.

Indication:

~Examination:
CT HEAD WO CONT

Indication:
Altered mental status

Comparison:
CT brain June 20, 2012

Technique:
Non-contrast axial 5 mm contiguous sections were obtained through the head. Patient age specific scan parameters were used for radiation exposure.

Findings:
Mild cerebral volume loss is noted. Mild amount of deep white matter and periventricular low-attenuation foci likely result of chronic small-vessel ischemic disease. 5 mm focus of calcification in the left periventricular white matter posteriorly, 2/17, unchanged compared to the prior examination.

No acute territorial infarct. No intracranial hemorrhage. No extra-axial fluid collection. Basal cisterns are patent. No intracranial mass effect.

Orbits, paranasal sinuses, mastoid air cells are normal.

No depressed calvarial fractures.

Impression:
1. No acute infarct, hemorrhage, or mass.
2. Mild cerebral volume loss and likely chronic small vessel ischemic disease.

~RESIDENT PRELIMINARY NEURORADIOLOGY REPORT

Exam: CT of the head without contrast

History: Fall with spine fractures

Technique: 5 mm axial images from skull base to the vertex without intravenous contrast.

Comparison: None

Preliminary findings:
No acute intracranial abnormalities. No definite fracture visualized. Scattered BG lacunar infarcts.

This is a preliminary report dictated by Dr. Jacob Merrell

ATTENDING FINAL REPORT

Findings:
The final report concurs with the preliminary report.

****
No intracranial hemorrhage. No midline shift or mass effect. Ventricles are normal in size. Basal cisterns are patent.

No loss of cortical gray-white differentiation to indicate stroke. Lacunar infarcts adjacent to the right caudate head and within the left centrum semiovale. These are age indeterminate.

There are a few scattered dystrophic calcifications within the left hemisphere.

Vascular calcifications indicate atherosclerosis.

Surgical changes of lens replacement. .

Paranasal sinuses and mastoid air cells are well aerated.

Final
Impression:
Lacunar infarcts in the right basal ganglia and left centrum semiovale. No acute cortical infarction.

No hemorrhage or focal mass lesion.

Diagnosis:upright post TLSO placement
History:
Comment:
Assisting Radiologist(s):Scott Culbertson 502389

~Examination:
CT L SPINE WO CONT

Indication:
compression fx l3-l5, pain

Comparison:
Lumbar spine plain films obtained earlier the same day; prior lumbar spine plain films of 04/05/2005. Thoracic spine plain films of 02/25/2008.

Technique:
Non-contrast axial 0.625 mm spiral sections were obtained through the lumbar spine from the T12 through S1. Sagittal and coronal reformatted images were performed. Patient age specific scan parameters were used for radiation exposure.

Findings:
Note is made of a moderate hiatal hernia. Diffuse moderate to severe calcific atherosclerotic vascular disease of the abdominal aorta and iliofemoral vasculature is noted. Generalized bony demineralization is seen. Mild left convexity scoliosis of the lumbar spine is identified which appears slightly progressed compared with prior examination of 2005. There is mild straightening of the normal lumbar lordosis.

Mild anterior wedge/central compression deformity involving the T12 vertebral body and mild compression deformity of the superior endplate of the L2 vertebral body are again noted and appear unchanged dating back to 2008. Age indeterminate mild compression deformity involving the superior endplate of the L3 vertebral body is noted. The L4 and L5 vertebral bodies are within normal limits for size. No posterior bony retropulsion is identified. No fracture of the the middle or posterior column is noted. No paraspinous hematoma is identified.

Multilevel degenerative loss of intervertebral disc space is noted with associated vacuum disc phenomenon. Marginal osteophyte formation is seen along the right lateral aspect of the vertebral bodies at L2, L3, and L4. Mild-to-moderate multilevel facet joint hypertrophy is also seen.

At T12-L1 there is no significant central canal or neural foraminal narrowing.

At L1-2 there is a mild broad-based disc bulge along facet joint hypertrophy and ligamentum flavum thickening resulting in mild central and mild bilateral neural foraminal narrowing.

At L2-3 there is a mild broad-based disc bulge, eccentrically greater on the right along with facet joint hypertrophy and ligamentum flavum thickening resulting in moderate narrowing of the right lateral recess and right neural foramen.

At L3-4 there is broad-based disk bulge, asymmetrically greater on the right volume left lamina flavum thickening and facet hypertrophy result in moderate right lateral recess/central canal narrowing and moderate to severe right neural foraminal narrowing.

At L4-5 there is severe degenerative loss of intervertebral disk material with associated endplate bony sclerosis and moderate to severe facet joint hypertrophy and ligamentum flavum thickening. constellation of findings results in mild to moderate trefoil tight central spinal stenosis, and moderate to severe bilateral neural foraminal narrowing.

At L5-S1 there is a broad-based disc bulge along with moderate facet joint hypertrophy resulting in moderate central canal and moderate to severe bilateral neural foraminal narrowing.

Impression:
1. Age indeterminate although likely chronic mild compression deformity of the superior endplate of the L3 vertebral body. Chronic mild anterior wedge compression deformity of T12 and mild superior endplate compression deformity of the L2 vertebral body unchanged dating back to 2008.

2. Multilevel degenerative scoliosis and spondylosis of the lumbar spine with resultant moderate central (greatest at L3-4) and moderate to severe neural foraminal narrowing at multiple levels (L3-4, L4-5, L5-S1) of the lumbar spine as described above.

Critical Results

Communication
A critical finding was noted on 12/06/2012 1:26 PM.
Findings were communicated by Culbertson, Scott D, MD to Erskine, Teresa Myers, ARNP on 12/06/2012 1:26 PM.

~Examination:
XR L SPINE 2-3 VIEWS

Indication:
fall, pain

Comparison:
Thoracic spine radiographs on February 25, 2008

Findings:
Alignment demonstrates convex left curvature centered at L3. There is a suggestion of retrolisthesis of L3 on L4, and evaluation is complicated by obliquity.
There are compression deformities of multiple vertebral bodies. Wedging of T12, L1, and L2 is similar to the 2008 thoracic spine radiograph, consistent with remote injuries.
Mild anterior wedging (approximately 20 percent) of L3 is consistent with compression injury of indeterminate age.
There is also mild height loss of the L5 vertebral body which is poorly visualized due to scoliosis and of indeterminate age.
There is disc space loss at multiple levels, worst at L4-5.

Findings discussed with Teresa Erskine at 11:30 on December 6, 2012

Mammography Screening

What is the REASON you are having a breast imaging exam?
(please select one)

- [x] This is a routine (screening) exam. I am not having breast problems.
- [ ] I am having breast problems: _____
- [ ] This is additional exam requested from a recent study.
- [ ] This is a short interval follow-up request from my last exam *(1-11 months ago)*.
- [ ] I have breast implants, but I am not having any problems.
- [ ] This is a review of an outside study.
- [ ] I am going to have breast reduction.
- [ ] I am going to have radiation therapy.
- [ ] This is an additional exam requested from my current screening exam.
- [ ] I have a history of benign breast disease.
- [ ] I have a personal history of breast cancer with breast conservation therapy.

Check all of the following RISK FACTORS that are true for you:

- [x] No one in my family has had breast cancer
- [ ] My aunt, grandmother, or cousin had breast cancer
- [ ] My mother or sister had breast cancer after their periods stopped
- [ ] My mother or sister had breast cancer while they were still having their periods
- [ ] I do not know my family breast cancer history
- [ ] I have had breast cancer [ ] I have had endometrial cancer
- [ ] I have had a previous breast biopsy that showed a high risk lesion
- [x] I have been through menopause
- [ ] I have never had children [ ] I had my first child after age 30

If you ever used any of the following Hormones, please enter:

WHITE - MEDICAL RECORD

REV DEC 11

~Examination:
CT HEAD WO CONT

Indication:
CT head wo contrast, 87 year old female who on Monday fell from 2 or 3 steps up a ladder hit her head on chopping block, believes she lost consciousness (unobserved). She is on coumadin. Now compalins of right occipital headache. ENT and Neuro exam un revealing.

Comparison:
3/30/2007

Technique:
Non-contrast axial 5 mm contiguous sections were obtained through the head. Patient age specific scan parameters were used for radiation exposure.

Findings:
Brain parenchyma: Multiple focal hypodensities within the basal ganglia and posterior limb of the right internal capsule likely represent lacunar infarcts and are similar in appearance to March 30, 2007. There is moderate diffuse cerebral volume loss and hypoattenuation within the subcortical white matter are non specific but consistent with microvascular ischemic change. Calcifications within the basal ganglia and posterior left parietal lobe white matter are similar compared to 2007. No acute infarct, hemorrhage or mass lesion.
Ventricles, sulci and cisterns: Symmetric and midline. The basal cisterns are patent.
Extra-axial: No extra-axial fluid collections.
Sinuses, mastoids, bony structures: normal, no fractures

Impression:
No acute intracranial abnormality. No mass, acute infarct, or hemorrhage.

Multiple small hypodensities within the basal ganglia and posterior limb of the right internal capsule likely represent prior lacunar infarcts.

Critical Results

WHITE - MEDICAL RECORD

REV MAR 11

~EXAMINATION:
XR HAND 2 VIEWS BILAT/RT/LFT

BILATERAL

Indication:
rule out erosive arthritis

Comparison:
July 2001

Findings:
Right: Asymmetric joint space narrowing with osteophyte formation and subchondral sclerosis is most pronounced at the DIP joints of the 2nd through 5th digit interphalangeal joint of 1st digit. These findings are consistent with osteoarthritis. Lesser degrees of similar changes are seen at the PIP and MCP joints as well as involving the 1st CMC joint. No erosions are demonstrated. No acute fracture or dislocation. There is soft tissue swelling adjacent to the DIP and PIP joints.

Left: Asymmetric joint space narrowing with osteophyte formation and subchondral sclerosis involves the DIP joints of the 2nd through 5th digits. This is consistent with osteoarthritis. Similar, but lesser degrees, are seen involving the PIP and MCP joints of the 2nd digit, interphalangeal joint of the 1st digit, and 1st CMC joint. The included wrist shows osteoarthritis at the radiocarpal articulation. No acute fracture or dislocation. No erosions. There is soft tissue swelling adjacent to the DIP and PIP joints.

VASCULAR DIAGNOSTIC SERVICE

This is an 82-year-old female with history of left common and external iliac vein chronic occlusion and right lower extremity chronic deep venous thrombosis who is referred for lower extremity venous duplex evaluation.

The patient presents post-operatively from hip surgery with lower extremity swelling.

A Philips ultrasound system was used for this exam.

LOWER EXTREMITY VENOUS DUPLEX (COMPLETE)

RIGHT SIDE

Deep System:

Doppler flow signals obtained within the common femoral, proximal profunda femoris, and popliteal veins are spontaneous, phasic and briskly augmentable. Paired posterior tibial and peroneal calf veins demonstrate briskly augmentable color-Doppler flow signals. Vein walls are compressible.

Proximal to mid main thigh femoral vein has wall thickening with partial vein wall compressibility. Reflux is present.

LEFT SIDE

Deep System:

Distal external iliac vein has no obtainable color/Doppler flow as noted previously. Proximal common femoral vein is patent with large collateral vein identified.

Doppler flow signals within the distal common femoral, proximal profunda femoris, main thigh femoral, and popliteal veins are continuous and briskly augmentable. Paired posterior tibial and peroneal calf veins demonstrate briskly augmentable color/Doppler flow signals. Vein walls are compressible.

IMPRESSION:

1. NO SIGNIFICANT CHANGE FROM PREVIOUS EXAM IN MARCH 07.

2. NO EVIDENCE OF ACUTE DVT IN THE RIGHT OR LEFT LOWER EXTREMITY.

3. EVIDENCE OF CHRONIC OCCLUSION/COLLATERALIZATION OF THE LEFT EXTERNAL ILIAC VEIN.

4. EVIDENCE OF CHRONIC WALL-THICKENING IN THE RIGHT MAIN THIGH FEMORAL VEIN.

END OF IMPRESSION:

* * * PRELIMINARY REPORT DICTATED BY RADIOLOGY RESIDENT ON-CALL * *
*

This is a preliminary CT report by the on-call radiology resident.
Final report by the Attending Radiologist will follow this report.

History: Fall, anticoagulation

Exam: Noncontrast head CT

Comparison: 4/4/05

Pertinent findings:

No intracranial hemorrhage.

There are unchanged periventricular and basal ganglia hypodensities related to microvascular ischemic disease. Volume loss as before.

I, Dr. Matthew Kogut, conveyed these findings to the ER attending at 11:30 PM on 3/30/07.

* * FINAL REPORT DICTATED BY ATTENDING RADIOLOGIST * *

NONCONTRAST HEAD CT:

INDICATION:
Fall. On anticoagulation.

TECHNIQUE:
Noncontrast 5-mm axial sections from skull base to vertex.

Comparison: Head CT scan from 04/04/2005.

FINDINGS:
There is slight prominence of the bifrontal hypodense extraaxial space anteriorly, which appears slightly enlarged compared with 2005

study. This may simply represent prominence of subarachnoid space secondary to mild cerebral volume loss, although a small subdural hygroma, perhaps chronic, cannot be entirely excluded. No evidence of hyperdense extraaxial fluid to suggest acute hemorrhage. The sulci and ventricles are mildly prominent, consistent with mild degree of cerebral volume loss without significant change. As before, there are multiple punctate hypodense foci consistent with basal ganglia and white matter, consistent with small lacunes without change. There is also a more diffuse patchy white matter hypodensity consistent with chronic small vessel ischemic changes, also stable. No evidence of mass, lesions, parenchymal hemorrhage, or acute protocol infarct. The craniofacial structures, including the sinuses, orbits, and skull base are stable and unremarkable.

IMPRESSION:
1. Agree with preliminary report. Essential negative noncontrast head CT scan without evidence of acute intracranial injury or hemorrhage. Minimal slight increased prominence of bifrontal extraaxial space likely incidentally.

VASCULAR DIAGNOSTIC SERVICE

This is an 82 year old female who is referred for lower extremity venous duplex evaluation. The patient presents following right calf swelling and redness approximately 10 days ago which has now resolved. She has a remote history of left lower extremity DVT and is on Warfarin.

RIGHT LOWER EXTREMITY VENOUS DUPLEX

Doppler flow signals obtained within the external iliac, common femoral, proximal profunda femoris, main thigh femoral, and popliteal veins are spontaneous, phasic, briskly augmentable, without reflux. Paired posterior tibial and peroneal calf veins demonstrate briskly augmentable color-Doppler flow signals without reflux. The right greater saphenous vein has been stripped. A small superficial vein is patent (normal flow patterns) in the calf along the path of the greater saphenous vein.

Complete vein wall compression is noted on B-mode image throughout the deep venous system (including gastrocnemius and soleal muscular branches where applicable)

IMPRESSION:

1. No evidence of acute deep or superficial thrombosis is identified in the veins in the right lower extremity.

END OF IMPRESSION:

VASCULAR DIAGNOSTIC SERVICE

This is a 80 year old female referred for carotid duplex and lower extremity venous and arterial evaluations.
Medical history includes past lower extremity venous thrombosis with post phlebitic syndrome and prior bilateral malleolar ulcers. There is also a possible history of stroke. She complains of leg pain and fatigue when walking up inclines. She gives a history of bilateral vein stripping or ligation. She is still taking Coumadin.

A Philips/ATL ultrasound system was utilized for this exam.

CAROTID DUPLEX, COMPLETE

Right Side:
There is minimal plaque is seen in the proximal internal carotid artery with normal velocities of 46-94 cm/s throughout and minimal flow disturbance.
Mild plaque is noted at the origin of the external carotid artery with normal velocity of 91 cm/s.
The right common carotid artery is unremarkable.

Left Side:
No appreciable plaque is seen in the proximal internal carotid artery with normal velocities of 64-79 cm/s throughout and minimal flow disturbance.
Mild plaque is noted at the origin of the external carotid artery with normal velocity of 94 cm/s.
The left common carotid artery is unremarkable.

The bilateral vertebral arteries are patent with normal antegrade flow.
The bilateral subclavian arteries are within normal limits.

--IMPRESSION--

1. 1-15% DIAMETER REDUCTION OF THE RIGHT INTERNAL CAROTID ARTERY.

2. NO PLAQUE OR STENOSIS IN THE LEFT INTERNAL CAROTID ARTERY.

3. NO SIGNIFICANT COMMON OR EXTERNAL CAROTID ARTERY STENOSIS.

4. BILATERAL VERTEBRAL AND SUBCLAVIAN ARTERIES ARE WITHIN NORMAL LIMITS.

--END OF CAROTID IMPRESSION--
==========

VASCULAR DIAGNOSTIC SERVICE

LOWER EXTREMITY VENOUS DUPLEX, (COMPLETE)

Prior lower extremity venous duplex findings:
12/12/01: No left lower extremity DVT
10/24/00: Chronic left iliac vein occlusion, nonocclusive chronic DVT left CFV

DUPLEX OF IVC AND ILIAC VEINS (COMPLETE)

Inferior Vena Cava (IVC) demonstrates spontaneous color and spectral Doppler flow.

The right common and external iliac veins are patent by color and spectral Doppler signals, with no obvious intraluminal echoes.
The left external iliac vein is not conclusively identified along its typical tract. Small color-filling vessels above and below the inguinal ligament are suggestive of collaterals.
The left common iliac is tentatively identified by color and spectral Doppler, although visualized vessel may be collateral(s). spontaneous and phasic intraluminal echoes are not visualized on B-mode image.

LOWER EXTREMITY VENOUS DUPLEX (COMPLETE)

RIGHT SIDE

Deep System:

The common femoral, proximal profunda femoris, main thigh femoral, and popliteal veins are compressible, spontaneous, phasic, briskly augmentable, without reflux.

Paired posterior tibial and peroneal calf veins appear compressible with valvular reflux demonstrated with compression maneuvers.

Superficial System:

The residual greater saphenous vein is patent at the femoral junction with no gross reflux.
An incompetent perforator is seen in the mid-distal calf.

LEFT SIDE

Deep System:

The common femoral, proximal profunda femoris, main thigh femoral, and popliteal veins are compressible, spontaneous, phasic, and augmentable. Valvular reflux is noted in the superficial femoral vein at mid thigh, and in the popliteal vein. No obvious residual thrombus is seen in the femoropopliteal segments.

Paired posterior tibial and peroneal calf veins appear compressible with valvular reflux demonstrated with compression maneuvers.

Superficial System:

The residual greater saphenous vein is patent at the femoral junction with valvular reflux noted.
Varicose veins below the knee appear compressible.
The lesser saphenous vein is not seen.
An incompetent perforator is seen in the mid-distal calf.

IMPRESSION:

1. NO EVIDENCE OF DEEP VEIN THROMBOSIS WITHIN THE INFERIOR VENA CAVA OR RIGHT ILIAC VEINS.

2. EVIDENCE OF CHRONIC OCCLUSION OF THE LEFT EXTERNAL ILIAC VEIN AS NOTED ON THE EXAM OF 10/24/00. PATENT LEFT COMMON ILIAC VS. WELL DEVELOPED COLLATERAL VEINS.

3. NO EVIDENCE OF ACUTE OR OBVIOUS CHRONIC RIGHT OR LEFT LOWER EXTREMITY DEEP OR SUPERFICIAL VENOUS THROMBOSIS.

4. DEEP SYSTEM VALVULAR INCOMPETENCE IS SEEN IN THE LEFT MID TO DISTAL SFV AND POPLITEAL, AND BILATERAL CALF VEINS.

5. THE RESIDUAL LEFT GREATER SAPHENOUS IS INCOMPETENT AT THE FEMORAL JUNCTION. INCOMPETENT PERFORATORS ARE NOTED IN THE BILATERAL MID TO DISTAL CALVES.

--END OF LOWER EXTREMITY VENOUS DUPLEX IMPRESSION--

The lesser saphenous vein is not seen.
An incompetent perforator is seen in the mid-distal calf.

IMPRESSION:

1. NO EVIDENCE OF DEEP VEIN THROMBOSIS WITHIN THE INFERIOR VENA CAVA OR RIGHT ILIAC VEINS.

2. EVIDENCE OF CHRONIC OCCLUSION OF THE LEFT EXTERNAL ILIAC VEIN AS NOTED ON THE EXAM OF 10/24/00. PATENT LEFT COMMON ILIAC VS. WELL DEVELOPED COLLATERAL VEINS.

3. NO EVIDENCE OF ACUTE OR OBVIOUS CHRONIC RIGHT OR LEFT LOWER EXTREMITY DEEP OR SUPERFICIAL VENOUS THROMBOSIS.

4. DEEP SYSTEM VALVULAR INCOMPETENCE IS SEEN IN THE LEFT MID TO DISTAL SFV AND POPLITEAL, AND BILATERAL CALF VEINS.

5. THE RESIDUAL LEFT GREATER SAPHENOUS IS INCOMPETENT AT THE FEMORAL JUNCTION. INCOMPETENT PERFORATORS ARE NOTED IN THE BILATERAL MID TO DISTAL CALVES.

--END OF LOWER EXTREMITY VENOUS DUPLEX IMPRESSION--

VASCULAR DIAGNOSTIC SERVICE

This is a 80 year old female referred for carotid duplex and lower extremity venous and arterial evaluations.
Medical history includes past lower extremity venous thrombosis with post phlebitic syndrome and prior bilateral malleolar ulcers. There is also a possible history of stroke. She complains of leg pain and fatigue when walking up inclines. She gives a history of bilateral vein stripping or ligation. She is still taking Coumadin.

A Philips/ATL ultrasound system was utilized for this exam.

CAROTID DUPLEX, COMPLETE

Right Side:
There is minimal plaque is seen in the proximal internal carotid artery with normal velocities of 46-94 cm/s throughout and minimal flow disturbance.
Mild plaque is noted at the origin of the external carotid artery with normal velocity of 91 cm/s.
The right common carotid artery is unremarkable.

Left Side:
No appreciable plaque is seen in the proximal internal carotid artery with normal velocities of 64-79 cm/s throughout and minimal flow disturbance.
Mild plaque is noted at the origin of the external carotid artery with normal velocity of 94 cm/s.
The left common carotid artery is unremarkable.

The bilateral vertebral arteries are patent with normal antegrade flow.
The bilateral subclavian arteries are within normal limits.

--IMPRESSION--

1. 1-15% DIAMETER REDUCTION OF THE RIGHT INTERNAL CAROTID ARTERY.

2. NO PLAQUE OR STENOSIS IN THE LEFT INTERNAL CAROTID ARTERY.

3. NO SIGNIFICANT COMMON OR EXTERNAL CAROTID ARTERY STENOSIS.

4. BILATERAL VERTEBRAL AND SUBCLAVIAN ARTERIES ARE WITHIN NORMAL LIMITS.

--END OF CAROTID IMPRESSION--
==========

VASCULAR DIAGNOSTIC SERVICE

LOWER EXTREMITY VENOUS DUPLEX, (COMPLETE)

Prior lower extremity venous duplex findings:
12/12/01: No left lower extremity DVT
10/24/00: Chronic left iliac vein occlusion, nonocclusive chronic DVT left CFV

DUPLEX OF IVC AND ILIAC VEINS (COMPLETE)

Inferior Vena Cava (IVC) demonstrates spontaneous color and spectral Doppler flow.

The right common and external iliac veins are patent by color and spectral Doppler signals, with no obvious intraluminal echoes.
The left external iliac vein is not conclusively identified along its typical tract. Small color-filling vessels above and below the inguinal ligament are suggestive of collaterals.
The left common iliac is tentatively identified by color and spectral Doppler, although visualized vessel may be collateral(s). spontaneous and phasic intraluminal echoes are not visualized on B-mode image.

LOWER EXTREMITY VENOUS DUPLEX (COMPLETE)

RIGHT SIDE

Deep System:

The common femoral, proximal profunda femoris, main thigh femoral, and popliteal veins are compressible, spontaneous, phasic, briskly augmentable, without reflux.

Paired posterior tibial and peroneal calf veins appear compressible with valvular reflux demonstrated with compression maneuvers.

Superficial System:

The residual greater saphenous vein is patent at the femoral junction with no gross reflux.
An incompetent perforator is seen in the mid-distal calf.

LEFT SIDE

Deep System:

The common femoral, proximal profunda femoris, main thigh femoral, and popliteal veins are compressible, spontaneous, phasic, and augmentable. Valvular reflux is noted in the superficial femoral vein at mid thigh, and in the popliteal vein. No obvious residual thrombus is seen in the femoropopliteal segments.

Paired posterior tibial and peroneal calf veins appear compressible with valvular reflux demonstrated with compression maneuvers.

Superficial System:

The residual greater saphenous vein is patent at the femoral junction with valvular reflux noted.
Varicose veins below the knee appear compressible.
The lesser saphenous vein is not seen.
An incompetent perforator is seen in the mid-distal calf.

IMPRESSION:

1. NO EVIDENCE OF DEEP VEIN THROMBOSIS WITHIN THE INFERIOR VENA CAVA OR RIGHT ILIAC VEINS.

2. EVIDENCE OF CHRONIC OCCLUSION OF THE LEFT EXTERNAL ILIAC VEIN AS NOTED ON THE EXAM OF 10/24/00. PATENT LEFT COMMON ILIAC VS. WELL DEVELOPED COLLATERAL VEINS.

3. NO EVIDENCE OF ACUTE OR OBVIOUS CHRONIC RIGHT OR LEFT LOWER EXTREMITY DEEP OR SUPERFICIAL VENOUS THROMBOSIS.

4. DEEP SYSTEM VALVULAR INCOMPETENCE IS SEEN IN THE LEFT MID TO DISTAL SFV AND POPLITEAL, AND BILATERAL CALF VEINS.

5. THE RESIDUAL LEFT GREATER SAPHENOUS IS INCOMPETENT AT THE FEMORAL JUNCTION. INCOMPETENT PERFORATORS ARE NOTED IN THE BILATERAL MID TO DISTAL CALVES.

Diagnosis:459.10
History:POST PHLEBITIC SYNDROME
Comment:
Assisting Radiologist(s):

History: Fall, neck pain.

Examination: 4 views of cervical spine

Comparison: none

Findings:

Alignment is anatomic. No fractures. Prevertebral soft tissues are normal.

RESULT DETAIL

Ordering Provider:LEONARD ROBERT FRANK 226910
Diagnosis:723.1
History:s/p fall
back and neck pain
Comment:
Assisting Radiologist(s):FIDEL REBELES 264040

Clinical history: Fall, back pain

Examination: 2 views of the lumbar spine

Comparison: June 6, 2001

Findings:

No acute fracture, dislocation or subluxation.

There is mild levoscoliosis. Extensive disc degeneration in the lower lumbar spine at L4 through S1 persists with mild anterolisthesis of L5 relative to S1. There is extensive abdominal aortic calcification.

RESULT DETAIL

Ordering Provider:LEONARD ROBERT FRANK 226910
Diagnosis:723.1
History:s/p fall
back and neck pain
Comment:
Assisting Radiologist(s):FIDEL REBELES 264040

CLINICAL PROBLEM/INDICATION:

Fall. On coumadin.

NONCONTRAST HEAD CT, 04/04/2005:

TECHNIQUE:

Noncontrast CT performed from the skull base through the vertex in 5-mm contiguous axial sections.

COMPARISON: No prior studies.

There is cerebellar greater than cerebral volume loss, mild to moderate. No intracranial hemorrhage. No midline shift or extraaxial collections.

Bilateral periventricular and left basal gangliar areas of hypodensity likely reflecting chronic microvascular disease. No acute changes. No hydrocephalus.

Sinuses, orbits, and mastoid air cells are unremarkable.

IMPRESSION:

1. No acute intracranial process.

2. Evidence for chronic microvascular ischemic disease and cerebellar greater than cerebral volume loss. Cerebellar volume loss may relate to drug toxicity, neurodegenerative process, or chronic alcoholism.

RESULT DETAIL

Ordering Provider:LEONARD ROBERT FRANK 226910
Diagnosis:959.01
History:FALL, ON COUMADIN
Comment:
Assisting Radiologist(s):LAWRENCE BUB 263320

A digital screening mammogram (certificate number 207290) was performed and computer-aided detection was applied.

The patient will be notified by letter of these findings. (Patients with findings requiring additional imaging will also be sent instructions on how to schedule this appointment).

No comparison films were available at the time of this reading.

Bilateral Breast Findings:
There are scattered fibroglandular densities. No significant masses, calcifications or other abnormalities are seen.

IMPRESSION:

BILATERAL BREASTS - Category 1
Negative, no evidence of malignancy. Normal interval follow-up is recommended in 12 months.

OVERALL ASSESSMENT - NEGATIVE
END OF IMPRESSION

Bilateral Breast Findings:
There are scattered fibroglandular densities. No significant masses, calcifications or other abnormalities are seen.

IMPRESSION:

BILATERAL BREASTS - Category 1
Negative, no evidence of malignancy. Normal interval follow-up is recommended in 12 months.

OVERALL ASSESSMENT - NEGATIVE
END OF IMPRESSION

RESULT DETAIL

Diagnosis: V76.12
Ordering Provider: WILLIAM NEIGHBOR 006267
Assisting Radiologist(s): JUAN MILLAN 263310,

CLINICAL PROBLEM/INDICATION:

Numbness on the left side.

CT HEAD WITHOUT CONTRAST:

COMPARISON: None available.

TECHNIQUE:

5 mm axial sections were obtained from the base of skull to vertex without injection of contrast.

FINDINGS:

There are bilateral multiple areas of low attenuation in the basal ganglia, thalamus, centrum semiovale and periventricular deep white matter. There is an area of hyperdensity in the right anterior internral capsule, which is of indeterminate chronicity.

There is no obvious intracranial hemorrhage identified. There is no midline shift. The ventricles, sulci and basal cisterns appear prominent and represent volume loss appropriate for age.

The orbits, mastoids and paranasal sinuses appear normal.

IMPRESSION:

1. BILATERAL MULTIPLE SMALL HYPODENSITIES IN BASAL GANGLIA, THALAMUS, CENTRUM SEMIOVALE, PERIVENTRICULAR DEEP WHITE MATTER PROBABLY ARE AREAS OF OLD ISCHEMIC INFARCT.

2. AN AREA OF HYPODENSITY IN THE ANTERIOR LIMB OF THE INTERNAL CAPSULE ON THE RIGHT IS OF INDETERMINATE CHRONICITY. BRAIN MRI WITH DIFFUSION IS RECOMMENDED TO RULE OUT ACUTE INFARCT.

END OF IMPRESSION:

SURGICAL PATHOLOGY REPORT

CLINICAL DATA:
Chronic recurrent papules.

GROSS DESCRIPTION:
A) Received in formalin designated “right chest" is a 0.4 x 0.3 x 0.2 cm, irregular, tan-brown, soft tissue, which is entirely submitted in cassette A1.

HV/las

MICROSCOPIC DESCRIPTION:
A) The epidermis contains mild basal layer atypia, extending to the lateral margins. The overlying corneal layer is orthokeratotic. There is solar elastosis. The dermis contains histiocytes with abundant pale blue-gray cytoplasm, suggestive of mucin. Step sections were performed.

FINAL DIAGNOSIS:

A) Skin, right chest, biopsy: Solar elastosis with slightly increased dermal histiocytes, see comment.

COMMENT: These changes are subtle and non-specific. Step sections were performed to rule out granulomatous/xanthomatous/myxomatous disorders. If lesions persist, rebiopsy may be contributory.

MT/las

Procedures used to establish the diagnosis:

MORRISON, ELIZABETH D
KUVER, RAHUL P

CLINICAL DATA:
73-year-old female with dysphagia x 1 year/chronic heartburn for years.
Endoscopic findings of stricture.

GROSS DESCRIPTION:
A) Received in Hollande's designated "distal esophagus" are two biopsies measuring 0.3 and 0.4 cm.

MICROSCOPIC DESCRIPTION:
A) Sections are of esophageal squamous and gastric cardiac-type mucosa. There is no significant inflammation, and no intestinal metaplasia is present. No Helicobacter pylori are identified. There is no evidence of malignancy. H&E and Genta stains were performed to help evaluate the histologic changes; all controls were appropriately positive.

End of Report

This is a negative result. Laboratory testing alone cannot rule out infection, particularly in the presence of clinical risk factors such as symptoms or exposure history.
Performed using the Panther (H) SARS-CoV-2 Transcription Mediated Amplification (TMA) assay. Additional details available here: https://testguide.labmed.uw.edu/NCVQLT.
This test is not yet approved or cleared by the United States FDA. When there are no FDA-approved or cleared tests available, and other criteria are met, FDA can make tests available under an emergency access mechanism called an Emergency Use Authorization (EUA).
The EUA for this test is supported by the Secretary of Health and Human Service's (HHS's) declaration that circumstances exist to justify the emergency use of in vitro diagnostics for the detection and/or diagnosis of the virus that causes COVID-19.
This EUA will remain in effect (meaning this test can be used) for the duration of the COVID-19 declaration justifying emergency of IVDs, unless it is terminated or revoked by FDA (after which the test may no longer be used).

End of Report																	

These results are presumptive and have not been confirmed as positive by an alternate method.

Results are for medical management only, and should not be used for legal purposes nor for workplace or pre-employment testing.

Qualitative immunochemical testing for amphetamines, barbiturates, benzodiazepines, cocaine metabolites, methadone, opiates, phencyclidine (PCP), cannabinoids, and tricyclic antidepressants. Positive results indicate immunoreactivity greater than or equal to these calibrators: d-methamphetamine 500 ng/mL, secobarbital 200 ng/mL, lormetazepam 200 ng/mL, benzoylecgonine 150 ng/mL, methadone 150 ng/mL, morphine 300 ng/mL, phencyclidine 25 ng/mL, nortetrahydrocannabinoic acid 50 ng/mL, nortriptyline 1000 ng/mL and acetaminophen 5 mcg/mL.

Quantitative testing for ethanol is by an enzymatic method. Results less than 10 mg/dL are reported as negative.

This test was developed and its performance characteristics determined by the University of Washington Department of Laboratory Medicine. It has not been cleared or approved by the US Food and Drug Administration.
This laboratory is certified under the Clinical Laboratory Improvement Amendments (CLIA) as qualified to perform high complexity clinical laboratory testing. This test is used for clinical purposes. It should not be regarded as investigational or for research.

End of Report																	

Testing performed using the Hologic SARS-CoV-2 Real-time RT-PCR assay. See https://testguide.labmed.uw.edu/NCVQLT for details.
This test is not yet approved or cleared by the United States FDA. When there are no FDA-approved or cleared tests available, and other criteria are met, FDA can make tests available under an emergency access mechanism called an Emergency Use Authorization (EUA).
The EUA for this test is supported by the Secretary of Health and Human Service's (HHS's) declaration that circumstances exist to justify the emergency use of in vitro diagnostics for the detection and/or diagnosis of the virus that causes COVID-19.
This EUA will remain in effect (meaning this test can be used) for the duration of the COVID-19 declaration justifying emergency of IVDs, unless it is terminated or revoked by FDA (after which the test may no longer be used).

End of Report

These results are presumptive and have not been confirmed as positive by an alternate method.

Results are for medical management only, and should not be used for legal purposes nor for workplace or pre-employment testing.

Qualitative immunochemical testing for amphetamines, barbiturates, benzodiazepines, cocaine metabolites, methadone, opiates, phencyclidine (PCP), cannabinoids, and tricyclic antidepressants. Positive results indicate immunoreactivity greater than or equal to these calibrators: d-methamphetamine 500 ng/mL, secobarbital 200 ng/mL, lormetazepam 200 ng/mL, benzoylecgonine 150 ng/mL, methadone 150 ng/mL, morphine 300 ng/mL, phencyclidine 25 ng/mL, nortetrahydrocannabinoic acid 50 ng/mL, nortriptyline 1000 ng/mL and acetaminophen 5 mcg/mL.

Quantitative testing for ethanol is by an enzymatic method. Results less than 10 mg/dL are reported as negative.

This test was developed and its performance characteristics determined by the University of Washington Department of Laboratory Medicine. It has not been cleared or approved by the US Food and Drug Administration.
This laboratory is certified under the Clinical Laboratory Improvement Amendments (CLIA) as qualified to perform high complexity clinical laboratory testing. This test is used for clinical purposes. It should not be regarded as investigational or for research.

Specimen Description: Urine Gray top tube
Special Requests: None
Culture: 30000 Col/mL Escherichia coli
Culture: 50000 Col/mL Mixed flora (>= 3 colony types)
Culture: Providers, see link for important guidelines regarding the interpretation of susceptibility reports: http://tests.labmed.washington.edu/abx
Report Status: Final 10/20/2018

Escherichia coli

	Microtiter MIC Interp	Microtiter MIC Value (mcg/mL)
Ampicillin	R	>16
Ampicillin/Sulbactam	I	16
Aztreonam	S	<=1

Notes:
1.) (Medium Importance) Result Comment by Contributor_system, ORCALAB on September 12 2018 12:06 A value of 0.04 ng/mL is the 99th percentile for a healthy population. Consensus guide lines for interpreting troponin results slightly above the 99th percentile are available at JACC 2012, 60:2427-63. Notes:
1.) (Medium Importance) Result Comment by Contributor_system, ORCALAB on September 12 2018 04:40 A value of 0.04 ng/mL is the 99th percentile for a healthy population. Consensus guide lines for interpreting troponin results slightly above the 99th percentile are available at JACC 2012, 60:2427-63. For additional information see http://tests.labmed.washington.edu/TROPIG

End of Report

These results are presumptive and have not been confirmed as positive by an alternate method.

Results are for medical management only, and should not be used for legal purposes nor for workplace or pre-employment testing.

Qualitative immunochemical testing for amphetamines, barbiturates, benzodiazepines, cocaine metabolites, methadone, opiates, phencyclidine (PCP), cannabinoids, and tricyclic antidepressants. Positive results indicate immunoreactivity greater than or equal to these calibrators: d-methamphetamine 500 ng/mL, secobarbital 200 ng/mL, lormetazepam 200 ng/mL, benzoylecgonine 150 ng/mL, methadone 150 ng/mL, morphine 300 ng/mL, phencyclidine 25 ng/mL, nortetrahydrocannabinoic acid 50 ng/mL, nortriptyline 1000 ng/mL and acetaminophen 5 mcg/mL.

Quantitative testing for ethanol is by an enzymatic method. Results less than 10 mg/dL are reported as negative.

This test was developed and its performance characteristics determined by the University of Washington Department of Laboratory Medicine in a manner consistent with CLIA requirements. This test has not been cleared or approved by the U.S. FDA.

End of Report																	

Sepsis diagnosis in adults:
PCT <0.5 ng/mL Low risk for progression to severe systemic bacterial infection. Repeat level in 6-24 hours if infection is strongly suspected.
PCT >=0.5 and <2.0 ng/mL Moderate risk for progression to severe sepsis.
PCT >=2 and <10 ng/mL High risk for progression to severe sepsis.
PCT >=10 ng/mL High likelihood of severe sepsis or septic shock.

PCT concentrations <0.5 ng/mL do not exclude an infection, on account of localized infections (without systemic signs) which can be associated with such low concentrations, or a systemic infection in its initial stages (<6 hours).
Furthermore, increased PCT can occur without infection. PCT concentrations between 0.5 and 2.0 ng/mL should be interpreted taking into account the patient's history. It is recommended to retest PCT within 6-24 hours if any concentrations of <2 ng/mL are obtained.

Notes:
1.) (Medium Importance) Result Comment by Contributor_system, ORCALAB on September 10 2018 21:14 A value of 0.04 ng/mL is the 99th percentile for a healthy population. Consensus guide lines for interpreting troponin results slightly above the 99th percentile are available at JACC 2012, 60:2427-63. For additional information see http://tests.labmed.washington.edu/TROPIG

End of Report																	

Specimen Description: Stool
Special Requests: None
Shiga Toxins: Unable to perform Shiga toxins 1 and 2 testing: Specimen was improperly preserved for testing.
Culture: No Salmonella, No Shigella, No E. coli O157, No Yersinia enterocolitica, No Aeromonas, No Plesiomonas, and No Vibrio isolated.
Culture: No Campylobacter species isolated
Report Status: Final 06/07/2018

Tobramycin	S	<=1

Specimen Description: Wound Left lateral Calf
Special Requests: None
Gram Smear: No polymorphonuclear cells seen
Gram Smear: 3+ Gram Positive Cocci
Culture: 4+ Staphylococcus aureus, coagulase positive : methicillin-susceptible (MSSA)
Culture: 3+ Pseudomonas aeruginosa
Culture: 3+ Diphtheroids
Report Status: Final 06/04/2018

Specimen Description: Tissue Left lateral Calf
Special Requests: Includes Anaerobic screen
Gram Smear: No polymorphonuclear cells or organisms seen
Culture: 3+ Enterobacter cloacae : This bacterial species is known to produce a chromosomal AmpC inducible beta-lactamase. Penicillin or third-generation cephalosporin monotherapy for serious infections may result in the emergence of high-level resistance. : Multi-Drug Resistant Organism - For inpatients, isolate using contact precautions per institutional policy. Contact Infection Control if you have any questions.
Culture: 2+ Staphylococcus aureus, coagulase positive
Report Status: Final 01/14/2018

Enterobacter cloacae

End of Report

These results are presumptive and have not been confirmed as positive by an alternate method.

Results are for medical management only, and should not be used for legal purposes nor for workplace or pre-employment testing.

Positive results indicate immunoreactivity greater than or equal to that of: d-amphetamine 1000 ng/mL, d-methamphetamine 1000 ng/mL, secobarbital 300 ng/mL, oxazepam 300 ng/mL, benzoylecogonine 300 ng/mL, methadone 300 ng/mL, morphine 300 ng/mL, phencyclidine 25 ng/mL, nortriptyline 1000 ng/mL.

End of Report																	

Results for quantitative testing less than 10 ng/mL (except fentanyl 0.25 ng/mL and 6-monoacetyl morphine 5 ng/mL) and results for qualitative testing less than 50 ng/mL (except ethyl glucuronide 500 ng/mL) are reported as negative.

This test was developed and its performance characteristics determined by the University of Washington Department of Laboratory Medicine in a manner consistent with CLIA requirements. This test has not been cleared or approved by the U.S. FDA.

Specimen Description: Urine Gray top tube
Special Requests: Reflexed from urinalysis.
Colony Count: 60000 Col/mL
Culture: 3+ Escherichia coli
Culture: Comment: See link for important guidelines regarding the interpretation of susceptibility reports: http://tests.labmed.washington.edu/abx
Report Status: Final 08/26/2016

Escherichia coli

	Microtiter MIC Interp	Microtiter MIC Value (mcg/mL)

Specimen Description: Urine
Special Requests: None
Direct Exam: No polymorphonuclear cells or organisms seen
Colony Count: 25000 Col/mL
Culture: 3+ Escherichia coli
Culture: 2+ Mixed gram positive flora : at least 3 different colony types
Report Status: Final 09/18/2015

Specimen Description: Urine
Special Requests: none
Direct Exam: Rare Polymorphonuclear cells
Direct Exam: 1+ Gram Variable Rods
Colony Count: 8000 Col/mL
Culture: 2+ Proteus mirabilis
Culture: 2+ Escherichia coli
Culture: 2+ Gram positive flora
Culture: Comment: See link for important guidelines regarding the interpretation of susceptibility reports: http://tests.labmed.washington.edu/abx
Report Status: Final 11/08/2014

Proteus mirabilis

	Microtiter MIC Interp	Microtiter MIC Value (mcg/mL)
Ampicillin	S	<=8
Ampicillin/Sulbactam	S	<=8
Aztreonam	S	<=1
Cefazolin	S	<=2
Cefepime	S	<=0.25
Cefotetan	S	<=16
Ceftazidime	S	<=0.5
Ceftriaxone	S	<=0.25
Ciprofloxacin	R	>2
Doxycycline	R	>8
Ertapenem	S	<=0.12
Gentamicin	S	<=4
Levofloxacin	R	>4
Meropenem	S	<=1
Moxifloxacin	--	>2
Nitrofurantoin	R	>64
Piperacillin/Tazobactam	S	<=8
Trimeth_Sulfamethoxazole	S	<=2

Escherichia coli

End of Report																	

Positive results are presumptive and have not been confirmed by an alternate method.

Results are for medical management only, and should not be used for legal purposes nor for workplace or pre-employment testing.

Positive results indicate immunoreactivity greater than or equal to that of: d-amphetamine 1000 ng/mL, d-methamphetamine 1000 ng/mL, secobarbital 300 ng/mL, oxazepam 300 ng/mL, benzoylecogonine 300 ng/mL, methadone 300 ng/mL, morphine 300 ng/mL, phencyclidine 25 ng/mL, nortriptyline 1000 ng/mL.

Notes:
Value: Calculated GFR in mL/min/1.73 m2 by MDRD equation. Fairly accurate in outpatients in chronic kidney disease. May underestimate in others. Inaccurate with changing renal function. See http://depts.washington.edu/labweb/test/bclim/cGFR.html

Notes:
1.) (Medium Importance) Result Comment by Contributor_system, AMCIS LAB on April 01 2008 10:12 Elevated: >50.0 ng/mL. Deficient: 8.0 -15.0 ng/mL. Severe deficiency: < 8.0 ng/mL This test was developed and its performance characteristics determined by UW Medicine, Department of Laboratory Medicine. It has not been cleared or approved by the U.S. Food and Drug Administration.

Specimen Description: Urine Site not given
Special Requests: None
Direct Exam: No white blood cells seen
Direct Exam: Rare Gram Positive Cocci
Colony Count: 12500 Col/mL
Culture: 3+ Mixed flora at least 3 different colony types INCL 2+ Swarming Proteus
Report Status: Final 11102007

Title: Urine C and S
Document Version : 0

Encounter Number: LABU8170135200710
Facility: UWMC
Encounter Type: Ancillary
Admit Date Time: 10/01/2007 00:01:00
Discharge Date Time: 10/31/2007 23:59:59

Specimen Description: Urine
Special Requests: None
Colony Count: >100000 Col/mL
Culture: 4+ Escherichia coli
Culture: 2+ Mixed flora : at least 4 different colony types
Report Status: Final 10182007

Performed By: UW Medicine Roosevelt Clinic Lab 4245 Roosevelt Way NE Rm 160, Box 354710, Seattle WA 98105
Performed Date Time: 10/16/2007 14:32:00

Specimen Description: Urine
Special Requests: None
Direct Exam: No white blood cells or organisms seen
Colony Count: <100 Col/mL
Culture: No growth 2 days
Report Status: Final 04012007
